LAST HOURS MADE EASY.

Experience of a Professional Nurse at the Bed Side.

Courage in a Woman's Presence.

The Young Society Belle Who Wanted One More Drink of Champagne—An Aged Merchant Fears the Expense of Dying as Much as of Living—A Teamster Driving in Delirium.

"I have witnessed many curious death-bed scenes," said Mrs. Jeannette Robinson, a professional nurse employed at the Toronto hospital. "I am now forty years of age and have been a nurse for twenty years, though I have been in this country only ten.

"A few years ago I was called into a very aristocratic family. This family is very rich as well as aristocratic. As I am usually called upon only in critical cases I was not surprised to find the patient very low. She was the loved and petted only daughter. She had just made her debut the season before and her second social season was at its height. It appears that she was a very lively girl—a spoiled child—and had caught a severe cold at an entertainment. Instead of taking care of herself she went about as usual every night in evening dress. When I arrived at the house I found her lying in a magnificent room practically at the point of death with pneumonia. Three physicians were in consultation. The family was terribly frightened. The girl was very lovely, for pneumonia is a sudden disease and she had not been in bed more than two days. I found her wandering in her mind. She seemed to half comprehend what I was, for she turned her dark eyes on me a moment and inquired:

"'Will I be able to go to the ball?'

"'Ball! Mercy, child,' said I, trying to soothe her, 'don't think about balls. After a while"——

"'Ring for champagne!' she ordered imperiously. 'I'm going to dress for the ball. I must go.' She tried to hum a waltz, then suddenly exclaimed: 'Champagne! Champagne! Bring champagne! It warms the heart so! My heart is getting cold! Bring more champagne!'

"She choked and gurgled and her voice sank to a whisper.

"The doctors were at her side in a moment. It was evident her young life was fast ebbing. The stimulant was brought. Rising on her elbow she grasped the freshly opened bottle from the tray and before we had time to recover from our astonishment poured its sparkling contents down her throat. Her eyes shone like stars.

"'Champ—,' but the word was never finished.

"She flung the bottle from her, sank into the soft pillows and expired. I hadn't been there ten minutes."

"There was a rich old merchant over in Thirty fifth street whom I was called upon to attend. He had spent a lifetime in the accumulation of considerable wealth and in his old age went straight from his counting-house to his bed. He could scarcely be brought to realize that his stay on earth was short. His large family was very anxious concerning his future, but couldn't get him to consider the question. The family doctor told me his case was hopeless and instructed me to impress this fact on his mind, which was inclined towards business and trivial things. His daughter met me in the library and took me up to the sick room. She was a richly dressed and very lovely lady.

"'That is the way you spend my money,' said he from the bed as soon as we came forward. He paid no attention to me. 'Just look at that dress!'

"'Dear me! Never mind, papa—please don't talk of such things now. Try and fix your mind on more serious things now. This is the nurse.'

"'Nurse? nurse? I don't want any nurse. She can't be more serious than this thing of throwing away hard-earned money!'

"'While he had resisted every attempt to prepare him for death, a day or two later he was a little restless and lay eyeing me for a long time. He suddenly spoke up:

"'So I'm going to die, am I?' His voice was deep and harsh and sounded as if it came from the grave. I was startled almost out of my usual self-possession, but finally managed to tell him as gently as possible that his time on earth was very short indeed. If he had anything on his mind he'd better act accordingly.

"'Well, I 'spose I might as well get ready to go,' he growled, as if it bored him. 'Bring 'em in,' referring to his family.

"I hurriedly summoned his wife and children. He feebly tried to raise himself, but gave it up. Then he gave them an extended lecture on their mode of living. He reminded them that he had worked early and late to leave them a competence, and he hoped they wouldn't waste it in riotous living. They ought to curtail expenses and reform on certain matters of dress. Though he was terribly exhausted when he finished, he waved them aside abruptly, and growled:

"'Now get out and send in the other gang!'

"He lectured the rest in the same way. One of the members of his family remained after the rest had gone out. It was his young son. I held my finger on the old man's pulse. It was flickering.

"'Can you pray,' he suddenly asked the young man.

"'Yes, father,' sobbed the lad, his heart almost bursting.

"'Well, then, preach up,' was the hoarse reply.

"The boy fell upon his knees by the bedside and uttered a few choking words, while the old man rested his hand upon his son's head. In half a minute the old merchant was dead."

* * *

"Widely different," continued the nurse, "was a case I was called upon to attend when I was in England. It was that of an old man, too—a rich country Squire. He was a terrible old fellow, who had a reputation all over the country side of having lived a reckless life, of being a grinding landlord, an atheist and even a terror to his family. In fact he had driven them out doors, one by one, until he was practically alone with his servants, a few greedy relatives keeping a risky place in the near background. But a single daughter had stuck to him, and she was afraid to say or do anything. Poor girl, she didn't know what to do. I had been sent for, and came up from London. The old man seemed to be about breathing his last when I got there, which was after dark. I shall never forget that night. It had been sultry all day. The sky was black with lowering clouds, and as I was driven from the station in a mail cart by a servant the road was lighted by vivid flashes of lightning that almost blinded us.

"They had darkened the windows of the sickroom, but the occasion flashes penetrated even there. I went straight to the bedside and took up the withered wrist. At first I thought the patient was already dead, his pulse was so weak and irregular and the breathing so feeble. But close attention for a moment convinced me he was still alive. A minute later I said to the terrified daughter: 'He's gone' and so it seemed.

"At that instant there was a terrible burst of thunder. It rocked the solid old country mansion on its foundations. The old man started up in bed to a sitting posture—just doubled up like a galvanized corpse twitching in every muscle.

"'What's that?' he asked, the death-rattle in his throat.

"I began to explain that it was a thunderstorm, when he flung his hands aloft and shouted with an awful oath:

"'It's the gates of hell opening for my soul!' and he fell back a corpse.

"I have the reputation of being the possessor of good magnetic powers. In some cases this influence serves greatly to reduces and soothe intractable and suffering patients. Once in an English hospital a difficult and dangerous surgical operation was being performed on a man who had been severely injured in an accident. He was a powerful young man and at times two able-bodied attendants were unable to hold him still. I was called in to assist. The moment I touched his hand he glanced at me appealingly and grasped mine. From that moment he bore the pain unflinchingly. I had turned his face away from the operators and laid my cheek against his. He scarcely murmured again during the whole time.

"When all was over, he placed both of his great arms around me and pressing me gently to his bosom kissed me on the lips. When they disengaged his arms he was dead.

* * * * * *

"I remember a teamster I nursed once in this hospital. His legs had been run over and crushed. An operation had been performed. He was constantly dilirious. He drove a team all day and all night, swearing the most fearful and original oaths all the time. He was the roughest character I ever had to watch. His foul language fairly rang through the ward. He had probably formerly enjoyed torturing the poor brutes he managed, for he would swing his right arm on high in the act of snapping a whip, all the time accompanying the motion with curses and demonical laughter. He seemed to be intent on putting an eye out, cutting an ear off, or bringing blood in some way, and when he imagined he had made an especially skilful stroke of this kind he would laugh and curse. It was terrible. He finally went off in one of these fiendish paroxysms. I believe that is the only case in all my experience in which I could feel no human pity—in which I was satisfied to see a man suffer and was almost if not quite glad that my patient was dead.

"I knew a case where a genial, good-hearted, whole-souled gentleman in New York lay sick with quick consumption. He had been a man about town and had hosts of friends. When he was convinced that he could live no longer he called some of these watchers about him, called for glasses, made each person fill up with him 'for the last time,' and lightly waving his own finger of whiskey above his head, cried:

"'Well, boys, I've had many a good time with you; here's for the parting drink! Good-by!' and he died as he had lived, a convivial man of the world."

THE CASPIAN SEA.

Remarkable Changes in Its Level, and Why They Have Occurred.

The Caspian Sea lies eighty-five feet below the level of the Black Sea, and is the greatest body of water in the world lying below the sea level. It is remarkable not only for this fact, but for the changes that have occurred in its level. About the first century of our era there is no doubt that the level of the sea stood eighty-five feet above its present horizon, and of course, spread over a vastly more extensive area than at present. The Russian Geographical society has printed a treatise, written by N. M. Philipof, of these remarkable changes of level. Since the early part of the Christian era a general and gradual decline of the level of the sea has taken place.

In the eighteenth century, however, there appear to have been a few periods when the level rose. From the beginning of the present century there has been a fall, but since 1865, judging from recent observations, the level has been higher. Lieut. Sokolof, a naval officer, while working in the Caspian region from 1843 to 1848, collected much information. He found that in the present century the level had steadily fallen, just as in the last century it has risen, causing great apprehension among the inhabitants of an inundation and given rise to the belief in periodical variations every thirteen years.

Lerch, while in Baku, in 1734 and 1747, found submerged buildings which had stood on dry land thirty years before, and he mentions a saying of the Persians that the sea rose and fell alternately every thirty years. Mr. Philipof has made a special study of the whole question. Inquiring into the causes of these changes of level, he finds a variety of influences at work, such as wind driving the water towards certain coasts, temperature of the air causing in summer evaporation and consequent fall in level, and in winter cold producing a rise in level. Rivers, rain, and earthquakes are also among the active agencies, causing fluctuations from month to month and from day to day.

The fishing vessel owners of Yarmouth have telegraphed the Minister of Fisheries protesting against the outrageous action of Newfoundland in refusing bait to Canadian vessels, and pointing out that half of Newfoundland's catch of codfish is taken in Canadian waters at Labrador, and that the Canadian coast there is used as a base of supply by thousands of Newfoundlanders. Minister of Fisheries Tupper has telegraphed back that the Government is urging Newfoundland to withdraw its prohibition, has sent a delegate to confer with Premier Whiteway and has also placed the case in the hands of the Imperial Government.

HOUSES IN ZULULAND.

They Look Like Big Beehives, and Women Build Them.

The Zulu woman is the architect and builder of the Zulu house, and the style of architecture is known in the colonies as "wattle and daub." It looks like an exaggerated beehive, for the Zulu mind has this peculiarity, that it can not grasp the idea of anything that is not round or elliptical in form. There are no squares in nature. To build her house, the woman traces a circle on the ground fourteen feet in diameter, and getting a number of long, limber branches, she sticks them firmly into the ground and then bends the tops over and ties them with fiber obtained from the numerous creepers, or "monkey ropes."

Then she twines thicker creepers in and out of these sticks, all round the circle of spaces about twelve inches apart, and then taking wattle (a kind of course grass or reed), she thatches the edifice, leaving a small hole at the top for a chimney, and another hole three feet square for a door. In front of this she builds a covered way, extending outward about three feet, and the exterior of the house is finished by a coating of "daub" or mud.

She then seeks the nest of the white ant, and digging them up, obtains a quantity of white clay, which she beats to powder, dries, and then, mixing it with water, kneads it until it is quite smooth. This she spreads all over the ground inside the hut, and beats it carefully until it is quite hard and free from cracks. This floor a good house-wife will scour twice a day, with smooth stones, until it is like a piece of polished marble.

The fireplace is near the door and is simply a ring of this clay to confine the embers in one place. The other necessaries found in a hut are a bundle of spear shafts, some drying tobacco, and several bunches of millet, hanging from the roof. Grouped around the walls are the three amasi (a species of sour milk) jars, the native beer jars, and open jars for holding grain.

Of course the dense wood smoke, rising, coats the roof, millet, and tobacco with soot, and long "fingers" of it hang in every direction; but the floor will be clean enough to eat on, and as long as that is so the socia Mrs. Grundy of the Zulu is satisfied.

Natural Gas as Fuel.

When natural gas was first employed for heating dwellings, several years ago, the devices for adapting it to stoves and grates were very crude, and the amount of gas consumed was correspondingly extravagant. The end of the pipe—from half an inch to an inch—was run into the stove or grate, a perforated iron burner was fitted upon it at right angles, and the cavity filled with broken fire brick, slag from the glass furnaces, door-knobs of procelain, balls of fire-clay, or other substances that would radiate a great deal of heat.

Frequently the bits of broken brick were whitewashed, as were the back and side walls of the grates; or they were artistically done in watercolors, the gas flames neither smoking the one nor burning off the other. After a time fire-clay was moulded into imitations of logs of wood, the cut ends of the logs, the cracks and knots and the bark with moss on it being imitated so successfully that the results could scarcely be told from the real back-logs of olden times.

These imitation logs were placed on large brass andirons, and when the flames were seen issuing from fissures, the illusion was complete to the sense of sight, and to the sense of feeling, too, for while "one side roasted, the other side froze," as used to be said of attempts at keeping warm by the fireplaces of our grandfathers.

But about a year ago it began to be noticed that the supply of gas was diminishing. People woke upon cold mornings to find only a sickly blue flame languishing at the bottom of the grate or stove, where once had been a roaring furnace. They were assured that there was plenty of gas; that some temporary obstruction in the pipes had caused the shortage, and all would soon be right.

And all was right as soon as the weather became warmer; but presently the gas companies were insisting that consumers should burn gas by meter, instead of paying so much for each fire, and consuming all they pleased. This initiated the economic stage of natural gas use.

Inventors set their wits to work, and soon the market was flooded with all sorts of devices for getting the largest amount of heat from a minimum consumption of gas. The deep-set back-walls of the fireplaces built for coal were moved out, and the throats of the chimneys stopped up.

Various metal heaters with reflecting surfaces and draughts arranged on scientific principles were made to set into the fireplaces, until a fire that formerly required from one hundred to one hundred and fifty feet of gas an hour could be made to do the same service with a consumption of but fifteen feet. When the price of gas was raised from ten cents to fifteen cents per thousand feet in Pittsburgh last winter, thousands of economic gas grates, ranges and stoves were sold during the first cold spell.

One of the cheapest and most cheerful devices now in use is an adaptation of asbestos to fire backs and radiating surface. A heavy cardboard, coated with abestos, is perforated with rows of holes, from which are suspended fringes of skein asbestos, which becomes incandescent in the flame, and gives forth a beautiful, scintillating glow which imparts great cheerfulness to the apartment, and at the same time radiates considerable heat.

But by far the most economical thing is a small sheet-iron stove, not much larger than a man's silk hat. This is lined with copper, and sometimes filled with asbestos fibre, and is connected with the supply pipe by means of gum hose, so that it can be set in the middle of the room or near the wall, as may be desired. One such stove, consuming no more gas than an ordinary argand burner, will heat a medium-sized room to a comfortable temperature, and reduce gas-bills to proportions correspondingly comfortable.

The New York *Times* says that it may be said of Barnum, as truly as it was said of Garrick, that his death has "eclipsed the gaiety of nations and diminished the public stock of harmless pleasure." He was the prince of showmen, and though he was sometimes styled the prince of humbugs, that was an estimate neither fair nor adequate. It was his especial boast that from the beginning of his career until the end of it he gave the people who went to see his "greatest shows" "the worth of their money," and it is generally conceded that the boast was jusrified. By successive generations of small boys Mr. Barnum, it is needless to say, has been especially venerated, and all his works along with him.

SPRING SMILES.

She—"So she married for love, did she?" He—"Yes; love of money."

The law-breaker may not boast himself an early riser, but he is quite apt to be up before the judge.

"Give me charge of the choir," remarked the devil, "and I care not who occupies the pulpit."

Figures won't lie, but give the figures to one who knows how to use them to advantage and he'll do the rest.

Lottie—"Gus, do ships have yard arms?" Gus—"I believe they do, Lottie." Lottie—"How perfectly lovely!"

A boy whose leg was recently repaired by grafting some skin from a dog complains now that his shin barks easily.

Snooker—"I bought these three-dollar trousers in a fit of economy." Hunker (surveying the garment)—"I don't see the fit."

"Talk about striking a tender chord," soliloquized the tramp at the woodpile; "this is one of the toughest cords I ever struck."

"I'm on to you," said the drop of ink to the blotter, in a tone of considerable asperity "Dry up," said the blotter savagely.

"I tell you, travel develops, a man. If he has anything in him it is bound to come out in travel." "Yes—particularly ocean travel."

Teacher—"How would you describe Henry VIII. of England?" Student—"I would describe him as a professional widower."

Mr. Gabb—"I hear Mrs. Dadd is going to move." Mrs. Gabb—"Yes she moves every six months since she got her new furniture."

The best thing about the good old times is that they have not got a return ticket. The past can't come back if it wants to ever so bad.

A woman never feels that she is altogether out of society so long as she gets an invitation every year to a fashionable milliner's opening.

"I am surprised at Charley's squandering so much money on a phonograph." "Well, I'm not. He always did like to hear himself talk."

Miss Lovell (just engaged)—"Oh, George! You are good enough to eat." Mr. Fearing—"Sh! Don't speak so loud! Bruno's just outside the window."

Weeks—"Well, how are things in Toronto? Have they named any new pie Aristotle yet?" Wentman—"No-o. But I heard a man there ask for a Plato soup."

Mrs. Bingo—"There! I knew it. Those moths have got at your dress suit and eaten a hole right through your pocket." Mr. Bingo—"I'll bet they were female moths."

Customer—"Why did you take your boy away from school?" Grocer—"They were ruining him for my business—trying to teach him that sixteen ounces make a pound."

She—"You never hear of women cashiers embezzling or running off with their employer's money." He—"Not often; but when it does happen they take the employer, too."

Hostetter McGinnis—"How is it, Mr. Schaumburg, that you can make money when you sell your goods at cost?" Mose Schaumburg—"Pecause I puys my goots below cost."

The incidental expence of presentation at court in England is said to be about five hundred dollars. In this country a man who is presented at court can frequently get off for three dollars and costs.

If everyone knew what every one thought about every one else the only real friend a man would have would be the little worthless yellow dog that never dies and refuses to be given away.

Minnie—"How kind it was of Mr. Yabsley to dance with each of those ancient Patterby girls! He has the spirit of a true gentleman." Mamie—"Yes; he is a genuine knight of the middle ages, so to speak.'

He (ardently)—"I love you." She (complacently)—"I know it." He—"I cannot live without you." She—"I know it." He—"I want you for my wife." She—"I know it." He—"Well?" She—"I 'no' it."

Mrs. Peterby—"Can you wash?" Matilda Snowball—"Ob course I kin wash, if it has ter be." "Can you cook?" "If it has ter be, ob course I kin cook." "Are you honest?" "You bet I'se honest, if I has ter be."

Office Boy—(with high literary and oratorical ambition)—"Mr. Dragg, may I ask you to maintain your eye on my lunch basket a few moments?" Old Employe—"Certainly." Office Boy—"Thanks. I will retaliate."

"Are you good at figures?" said the manager of the hotel. "I have trained myself systematically for hotel accounts," said the applicant for a position. "How?" "I never studied anything but addition and multiplication."

A trite paraphrase:

Love is a charmer of such wins ome mien
That to be worshipped needs but to be seen;
But seen too oft, familiar with her face,
We first have doubts, then warfare, then a case.

"I have withdrawn from ouah amatuah acting club," said Willie Washington. "Why?" "I couldn't stand it at any longah, yer know. I was cawst for the villain and Miss Pepperton was the heroine, and she was to say: 'Villain, do youah worst.'" "That was easy." "Y-a-a-s; but Miss Pepperton wouldn't repeat the words. Instead, she said I had already done as badly as any one could reasonably expect."

Lessons come from Chicago with reference to the attack of grippe, from which that city is now suffering to such an alarming extent. The medical men say that the filth of the city is responsible for the epidemic. One of them says: "There are the square miles of Chicago where streets and alleys have not been cleaned since last fall, where a garbage waggon is unknown, where the sewerage is inadequate, and the paving defective or wholly wanting. It is in such places that not only 'grippe,' but pneumonia, rheumatism, diphtheria, and typhoid fever reap their richest harvest. It is from such localities that the county hospital, the infirmary, and every other public charity is glutted with applicants for relief. One-fourth of their sickness is treated by charities, and one-third of those who die among them are buried at the public expense."

AGRICULTURAL.

Heifer Calves.

No one will deny that to have good milkers we must raise good heifer calves, and I wish to note a few things in this regard that I have found of practical service to me.

First, the calf paddock is one of the things to do away with. Why? Because as long as you are feeding skimmed milk the calf should be confined in a small shed with a chance to exercise in the cow yard where the cows are out on grass. My practice is to take the calf as soon as dropped and feed it the new milk of its dam for three or four days; then commence on sweet skim milk for one or two weeks; then gradually on to thick sour milk. Now at about this age is when most dairymen turn the calf into the paddock and it is just this period that is most critical in the calf's life. An attack of "scours" at this time is sure to make a "runt" or stunted cow. The cause is that grass and curdled milk do not work well together. Keep the calf in an inclosure with plenty of shade and good dry hay, either alfafa or any of the dried grasses.

If the calf was a very early one it will do to wean in the fall and have the run of the meadow until time to put up for winter care. The milk should be warmed to 60 or 65 degrees before giving to the calf. Some feed bran, middlings or oat meal, which is best. These never should be mixed with the milk but put in the bottom of the bucket after the milk has been drunk. It is not natural for a calf to drink grain any more than for a cow to do it.

Give milk from six to eight months with the grain ration increased to what the size of the calf demands to keep it growing until grass the next spring. The full calf has the best chance if properly housed and fed during the cold weather, as it is ready to wean at grass time and there is no danger of its getting into the grass paddock before the milk ration is taken off.

During the first winter if you have small potatoes, feed them; if not, a few beets, pumpkins, or any vegetable will help to make them healthy, and if healthy they are sure to make a good growth during the winter. See that they drink heartily of water at all times especially in the winter. If the water you give your cows has ice in it do not offer itto the calves. Warm it. See them drink with your own eyes. Never trust the chore boy or hired man about watering calves. They do not see the point.

W. F. Wing.

Kicking Cow.

The best device that ever I saw, is simply a strap with a buckle on one end and plenty of holes punched in the other. Wrap it twice around the opposite leg of the refractory animal, just above the gambrel joint, cross the strap between the legs, and draw up tight, and buckle around the other leg. With the legs thus fastened closely together it will be impossible for her to kick or get her feet in the pail, yet she stands perfectly natural.

Often the most simple methods are most effective. The device has been in use for many years in our barn and I can guarantee it. Can recommend it in breaking young heifers as superior to the milkingstool argument.—I. E. Tuttle.

Mr. C. Lamp, Illinois, gives these: (1) Stand the cow with her left side against a wall. Snap a bull ring in her nose and tie her head up. (2) Same as given by Mr. Tuttle.

No. 3. Bore a two-inch hole in the wall back of the cow, as high as her flank, take a pole long enough to reach from the wall to the manger, put one end in the hole, press the pole against the cow, and tie it fast. If she is very frisky use all three. Always use her gently and she will soon stand without these helps.

Mr. S. S. Maxin, Mass., says: Make a strap of sufficient length to go around the cow, let it come forward to the udder, close up to it, bring up over her back aft of her hip bones and buckle it tight, and you will have no trouble to milk your cow while the strap is on tight."

So far as learned but two of the New Orleans victims were not naturalized American citizens, and they were fugitives from justice in Italy, the one a murderer, the other a bandit and thug. Whether the contentions of the Italian Government be based upon sound principles of international law or not such a determination of the status of the victims should render, the Philadelphia *Record* is of opinion, any claim for damages absurd.

There are forty-eight firms in great Britain that during the past two years have adopted the profit-sharing principle, *i. e.*, they give their employees a dividend in addition to their wages. The difficulty that has been experienced in adopting this method has usually been that while an enterprise pays profitable dividends all goes well, but when it becomes necessary to divide the burden of losses there is friction. A large manufacturing concern in Brooklyn has recently introduced the profit-sharing system. Employees who have been in service for a specified time, and who have reached a proficiency which warrants it, are assigned one or more shares of stock, as the Board of Directors may decide. At the end of ten years the assigned share or shares pass over to the holder, and are his to hold or sell, as he may see fit. During the probationary period the interest paid is only six per cent., but after that it is a pro rata share of all the profits.

Mr. Carling's reports on the immigration of 1890 shows that 178,921 immigrants reached Canadian ports last year; but that the actual settlers in Canada numbered 75,077. The arrivals are fewer by ten or fifteen thousand per annum than we have had for five years. Our largest influx was in 1883, when we received 133,624. Of the new comers 13,917 are reported to have gone to Manitoba and the North-West. But it is not quite certain that the 13,917 were Europeans. The immigrants passing through Port Arthur were counted, and it stands to reason that an important percentage of them are Canadians seeking homes in the West. When the new bonusing system, under which $10 per head is given to actual settlers in the West and $5 per head to their families, comes to be felt we ought to have a large influx; that is, provided intending immigrants do not regard the offer of a bonus as a suggestion that there are disadvantages to be encountered in the Territories of which the books do not tell. But the reports of the farmer delegates, which have been exceedingly favourable, and not unjustly so, should remove any apprehensions on that score.
