SANDY SOIL MANAGEMENT

For drifting sands a plant known as sea-sand reed or beach grass has been used with considerable success. It is valuable because of its root-stock growth which enables it to grow up through rapidly accumulating sand. When the sand has been fairly well controllled, there are two other grasses, namely rattail and wild rye, which have been found useful. Unfortunately the supply of the seed of these plants is scarce.

There are many areas of blowsand which will never be fit for anything but the production of trees. It may be necessary, even, in the establish- to plant quick growing kinds, estabing of desirable types of trees, first lish beach grass, or use other methods to control the sand until the young permanent trees can secure a proper foot-hold. As to crop yields on sandy soils, there appears to be little difference in the amounts as a result of the various methods of ploughing.
