De Laval Cream Separators

In every corner of the world where butter is made, you will find these machines, also an established agency for their sale.

Over 400,000 of them in daily use; more than ten times all other makes combined.

After twenty-four years of uninterrupted success, they remain to-day the world's leading dairy machine.

THE DE LAVAL SEPARATOR CO., 77 York St., Toronto.

IN THE SPRING.

[illegible]

A Notable Spring Issue.

In the May Delineator is the first instalment of The Bess Bonbon, a novelette by Mary Harland Catherwood, the author of the popular Lazarre. The background of the story is intensely attractive and contains promise of great dramatic events in the later development of the plot. The illustrations by Charles H. Stephens are very striking. Tavia Varick, Mrs. Burns's introspective girl, in this number and appears to be the last word. [illegible] Ring the Moon is an excellent story by Percy Verrill Mighels. [illegible] Mrs. Burnham's interesting Paris Letter. [illegible] Geography. [illegible] Mrs. Burnham's Exterior [illegible] Old Boston by Lucy Bakers [illegible] Mrs. Burnham's with upper floor. Bianca Bates, the popular [illegible] Miss Langdon [illegible] Mrs. Burnham's [illegible] Mrs. Burnham's [illegible] Mrs. Burnham's [illegible] A Garden [illegible] Fashions [illegible]

IMMENSE OPPORTUNITY.

[illegible] Get a Beautiful Watch and Chain Free. No Money Required. Every Man, Woman, Boy, or Girl has the same Opportunity under our System.

AN IMPROVED HOTBED.

Interesting Pointers About Building and Managing Frames—How the Most Light and Air Can Be Secured.

Various forms of shutters or protectors for hotbeds have their relative convenience and excellence, but all are common in one respect, and that is in shutting out light. Even the light of a moonlight night is of value in plant growth, but not only must this be shut out, but also the twilight of the afternoon and two or more hours of frosty sunlight in cold mornings. This, added to cloudy days, leaves only an average of seven or eight hours of good light in every twenty-four in March, although the days average nearly twelve hours. Added to this are the constant care required, the lifting on and off of covers and the changing of amount of ventilation several times a day. In fact, a hotbed requires about as much looking after as a nursing infant if one would have uninterrupted and healthy plant growth. For this reason busy middle class people and farmers who do not as a rule keep a gardener cannot afford to run a hotbed, because the time needed is too valuable to spend on it. This shuts out many from enjoying fresh, early relishes and vegetables.

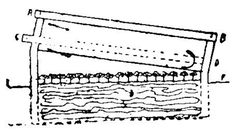
I know of no more serious annoyance as well as hindrance to best results than the difficulty of airing the common hotbed. After several cloudy, cold days and a large amount of confinement beneath glass, shutters the sun bursts out suddenly some morning for a twelve hours' ramble through an unclouded sky. The plants are drawn and soft and dripping with moisture, and it is absolutely necessary to have air or everything will cook. The only way is to tip the sash more or less and admit big volumes of outside air direct, untempered in the least, and it strikes the shrinking plants.

Mr. L. B. Pierce thinks he has solved some of these difficulties and found a remedy in a form of construction, which he illustrates and explains in Country Gentleman, the sketch showing a double sash arrangement in both and south elevations. F F is the ground surface, in which is set the ordinary frame to be filled with manure. This may be of rough lumber, the only requirements being true corners and a really dressed top edge. On this I would fit a really constructed frame five or six inches high, divided at every sash interval with an inch board of the same width as the outside frame. Either end and the middle should be entire boards, while the north side must be of two pieces, equalizing the thickness of an ordinary sash, say one and a half inches. Cleats an inch wide may be tacked upon the inside of the divisions and at the ends near the bottom of this upper frame, so that the sashes may be slid in from the north until the stops on the south side, where a cleat may also be nailed, making sure that it is a trifle below the other cleats, so as to slide on it.

The frame being constructed so as to be covered with an ordinary sash, say six feet from outside to outside, the sashes slid in to fit will project two inches at the north end for as the sash rod is usually nearly three inches wide there will be no opening. By having other sashes (A B) on top of the frame we shall have a thoroughly protected bed with a space of warm air between two transparent coverings. These may remain on night and day in very cold weather, and a double-size upper sash may be used in warm weather. However, my experience in using glass covers for beds inside of greenhouses goes to show that enough light is admitted through two thicknesses of glass for almost all purposes, provided the glass is kept clean, which, however, is impossible when both sashes are set exactly in place, a frequent practice in high winds.

A bed constructed as in the illustration is not only protected from [illegible] temperature [illegible] facilities [illegible] sash two [illegible] covering the three [illegible] lots, but mainly because [illegible] about three-quarters of an inch at the north side and [illegible] of two inches next the [illegible] end of the [illegible] Now, [illegible] the upper [illegible] a couple of [illegible] opening on top of [illegible] cold air is admitted [illegible] passes over the surface of the warm inner sash, drops down [illegible] and finds its [illegible] at the north end, the well shown arrows of air circulation doing the [illegible] It is thus a continuous [illegible] of tempered air.

Use when within a wheel or [illegible] of glass inside a greenhouse is [illegible] novelty, but its application to hotbed construction will, I believe, help those unfortunate enough to have to depend on the uncertainties of fermenting manure and the fickle March sun.



IMPROVED HOTBED CONSTRUCTION

A B, top sash; C D, inner sash; E F, ground line; Arrows indicate air circulation. S S, stays to keep sashes apart.

Economy in Little Things.

We once heard of a farmer who said he would not become surety on a note for a man who would light his pipe with a match while standing by the fire. Little things are pointers to character—letting the shoes burn while warming the feet, cutting the shoestring rather than untie it, leaving the saw out in the damp or throwing down more hay to stock than they will eat. Let the farm boys remember this.

For Better Seeds in Canada.

The seed division of the Dominion department of agriculture has commenced an active campaign against the sale of adulterated and impure seeds. Numerous bulletins dealing with the matter are being distributed. The farmers' institute speakers are delivering addresses on the subject in the various provinces. It is proposed to establish a series of seed fairs. At these fairs prizes will be offered to the farmers exhibiting the best seed of different varieties. The successful exhibitors will afterward be asked to sell as much of their good seed as they can spare.

Knew Him.

He—Darling, which would you rather have for a birthday present, an electric or a gasoline automobile?

Wife—I'd rather have $10, dear.—Automobile.

Monkey Brand cleans and brightens everything, but won't wash clothes.

INCUBATORS VERSUS HENS.

Reasons Why the Former Are Better For Hatching Purposes.

The day is past when the extensive poultryman tries to hatch with hens, as the way is entirely too slow. By the old way when he wanted to set 100 or 200 eggs as the case might be, he had to find nine or eighteen brood hens and as many separate nests. Then they must each be tested with artificial eggs to see if they all really were in earnest, and this took nearly a week, and consequently this much time was lost.

The incubator saves this time, and one will do the work of all these hens. Then after the hens were set they must be fed and watered daily and let out for exercise for at least fifteen or twenty minutes, and then their keeper must see that each one gets on her own nest. This must be done daily for about twenty-six days, including the test days, and yet I have said nothing about dusting for lice and the washing of some of the eggs which are sure to become dirty and the repairing of nests as a further result.

If all hens would behave just alike the task would not be quite so hard, but they will not, as some are overanxious and continually fuss and turn their eggs and break them in their efforts to do well, no matter what kind of nest they have. The incubator is not subject to this failing, but stays quietly in its place, and no broken eggs or crushed chicks are found. The best incubators require but five or ten minutes' daily attention and can be kept in a room of the dwelling or outshed near by and can be looked after very easily, while a sitting hen is such a disagreeable thing that she is best kept at a distance. The incubator has another strong point in its favor from the fact that it is willing to sit when wanted, and this is a matter of no small note, as the chick that is ready for sale when broiler prices are highest is the money maker of the market chickens, while the early pullet is the winter egg producer and price taker at the fair in the fall.

Of a certainty if you use the incubators as hatchers, you must use brooders as mothers, and this leaves the hens entirely free to do their best instead of running and eating with chicks and laying up fat which ought to go toward filling the egg basket. Chickens raised by artificial means escape the chance of being filled with lice before they are fairly out of the shell and being trampled to death by another hen and living in dirty quarters for one hen will make more dirt in a day than twenty-five young chicks.—F. Baugle, in American Poultry Journal.

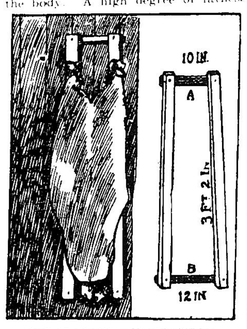
SHIPPING DRESSED LAMBS.

Best Winter Lambs For the Market—A Shipping Stretcher.

Winter lambs for market should weigh not less than forty-five pounds alive and be fat. This condition is determined somewhat accurately by feeling the brisket and the tail near the body. A high degree of fatness is more important than weight, as they sell by the carcass rather than by weight. The weight of two lambs being the same, the younger one will sell higher. The evidences of age are the fleece and the degree of ossification in the bones. Most lambs are marketed between the ages of ten and sixteen weeks, a few as young as eight weeks. The market for them extends from Christmas to Easter, according to an Ohio Farmer correspondent, who further says:

To prepare a dressed lamb for shipping, sew about each lamb a square yard of clean, new muslin, as shown in the cut. We have shipped in various ways and by both express and refrigerator freight. We now place each lamb on a stretcher, as shown in the second figure, and then wrap in burlap, which we get of the furniture dealers. We tried shipping in crates, but the crates would get crushed.

The diagram is a slight modification in form from the stretcher shown with a lamb on it. The side pieces should be about two inches wide and a half inch thick and made of light, strong timber, such as poplar, basswood or elm. The ten inch crosspiece should be one and a half inches square. A is a tenpenny nail driven through this piece diagonally, pointing toward the short protecting ends of the side pieces. This is to hold the lamb's neck in position as it is forced down upon it. Press the front legs down upon the neck and hold there with a twine around the stretcher. Loop short pieces of twine about the hind legs above the hocks and draw tightly, fastening at B. The legs should be cut off below the knee and hock.



DRESSED LAMB AND STRETCHER

Biddy Not a Growler.

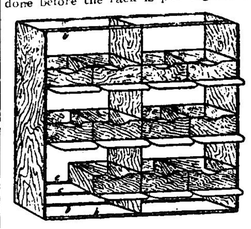
Biddy does not complain if she is uncomfortable; she simply stops doing business. If she has lost a toe, a comb or wattle, she does not utter a murmur, but her system sets about "restoring the waste places," and she cannot digest a sufficient surplus for egg production until all sores are healed and she is again comfortable.

PRACTICAL NEST BOXES.

They Are Light, Easily Made and Can Be Readily Cleaned.

The accompanying drawing illustrates very well the improved nests designed and successfully used by William Proctor of Essex County, Mass. They are very easily made, and the plan of construction is as follows: Take three boards 1 inch thick by 12 inches wide and of any convenient length. The boards are placed far enough apart to admit of two nests side by side.

Strips 2 inches wide and 1 inch thick, represented in the diagram as b b, are nailed across both top and bottom to hold the uprights in place and make the frame firm. Supports for the nest boxes are wires, designated by c c in the diagram, and to put them in place holes are augured through all the boards, which is best done before the rack is put together.



SIMPLE AND CONVENIENT.

Strips might well be used in place of the wires and would give additional strength. If wire is used, it will prove most satisfactory if kept tight.

The nest boxes are made of half inch lumber. They are 11½ inches wide, 12 inches long and 5 inches deep. The bottom is made to project six inches, providing a step for the hens to alight on. The space above the boxes would depend partly on the breed of poultry, but with boxes five inches high a fourteen inch space between wires will be sufficient. The improved nest boxes have the advantage of being light, easily made and readily cleaned.—American Agriculturist.

A Competent Farmer Lacking.

Things that should not be are numerous—a physician with an invalid family, a lawyer going to jail for contempt, a shoemaker's wife going barefooted, a tailor wearing patched trousers and a farmer going to town to buy bacon and canned goods for Christmastide. In these cases the physician was a quack, the lawyer an ignoramus, the shoemaker a worthless cobbler, the tailor a goose and the farmer as bad as the worst of them. Any farm that fails to supply itself with plenty of substantial food for man and beast and some to spare lacks a competent farmer to manage it.

Spring and Summer Fashions.

Flower effects are the chief distinction of the sheer summer fabrics. The Louisine silks have acquired such softness and grace that they are extensively used for the all-around summer gown, and the Habutai and Tokio varieties exhibit an embroidered elaboration that makes them appropriate for dressy wear. Taffettas are now procurable in a soft, rustleless quality.

The chiffons approach the silks in wearing quality, being much heavier than their predecessors.

Canvas is assuming great importance in the realm of spring frocks and coats; it is used as cloth, with strappings, stitchings, etc.

Basket-weave cotton cheviots, madras and mercerized cottons offer modish suggestions for the shirt-waist suit, and the smartest shirt-waists are made of mercerized fabrics, such as vesting, cheviot, linen and canvas.

Nearly every gown, whether made of a soft woollen or a sheer wash fabric, is characterized by shirring.

The reign of lace continues. Soft and filmy Tenériffe and Mexican laces are the novelties of the season.

The new braids, which will be used in profusion, are soft and pliable and well suited to forming designs on the gown, and the new buttons, glistening with colored stones and enamel, are examples of the highest art of the jeweller.—From The Delineator for May.

For Over Sixty Years.

MRS. WINSLOW'S SOOTHING SYRUP has been used by millions of mothers for their children while teething. If disturbed at night and broken of your rest by a sick child suffering and crying with pain of Cutting Teeth send at once and get a bottle of "Mrs. Winslow's Soothing Syrup" for Children Teething. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures Diarrhœa, regulates the Stomach and Bowels, cures Wind Colic, softens the Gums, reduces Inflammation, and gives tone and energy to the whole system. "Mrs. Winslow's Soothing Syrup" for children teething is pleasant to taste and is the prescription of one of the oldest and best female physicians and nurses of the United States. Price twenty five cents a bottle. Sold by all druggists throughout the world. Be sure and ask for MRS. WINSLOW'S SOOTHING SYRUP.

May Number New Idea Woman's Magazine.

In consonance with its name, the New Idea Woman's Magazine for May presents many novel features in dressmaking and in every department of domestic interest. It opens with a charming paper by Constance Fuller McIntyre upon "The Marriageable Age." Emma A. Osborne writes about New York's Chinatown delightfully; Katherine Louise Smith tells of the new fad, "Cat Shows and Catteries"; Nancy Hull has "The Living-Room" for her theme; and Ebec Rexford presents "Garden Gossip" in his authoritative manner. In addition to these special features, the several departments are attractively set forth, and in short stories and verse there is unusual variety and superior quality. The New Idea patterns offer many tempting opportunities to the home dressmaker.
