GOING NORTH.	GOING SOUTH.
8.50 a.m.	6.00 p.m.
10.15 a.m.	8.05 p.m.

The Hand Separator and Its Relation to the Creamery.

THE ADVANTAGES OF SELLING YOUR CREAM.

To the Farmer

Owing to the small number of cows kept by the average farmer, the cost of hauling to the creamery is so great that small routes are made very long there is no profit in handling the milk for either the farmer or the factory. The disadvantage in making these trips is that in the hot weather the milk is so long on the road that on its arrival at the factory it is often in a very poor condition for separating, and the skim milk returned is practically worthless for feeding purposes other than to hogs.

By establishing the cream gathering system we hope to greatly enlarge our present business by being able to take in more territory, and also make the dairy part of the farm more profitable, which would induce farmers to keep more cows.

As an inducement to farmers to put in a hand separator we are offering our regular $75 machine for $55, capacity 350 lbs. per hour, and our $100 machine for $75, capacity 750 lbs per hour. A world of reference to these machines. We guarantee them equal to any machine offered today of the same capacity, to last as long, skim as close, and are as durable. What we want is the opportunity of placing one machine along side of any other of same capacity, the farmer to be the judge as to their relative merits. We will go further and say that the machine we are offering for $55 of 350 lbs. Capacity, is the easiest running, closest skimmer, and most durable machine offered today at an advance of $20 to $30 on our price. A comparison. Our 350 lbs. machine is as easy to turn as a 250 lbs. machine, and much easier to turn than a 300 lbs. machine. The bowls are of the same diameter, and will prove equally as durable. These separators are sold with the understanding that they are to be run at least as fast as the average farmer turns his separator, and if they do not come up to the expectations of the purchaser they are not to be paid for. We would suggest that the farmer who is buying a separator for the first time, should pay more than the price of a good hand separator, for the reason that he will be more careful in taking care of it, and will get more satisfaction out of it than the man who has been used to a separator. We would also suggest that the farmer who is buying a separator for the first time
