Late that fall the land was ploughed
Early the following spring the land was harrowed down level and staked off 15X15 feet each way and planted with 1500 peach trees of the following varities, Greensboro, 5% Yellow St. John, 50% Early Crawford 15% Elberta 30% ripening in the order named. -

When danger of frost was passed the land was once more planted with corn and kept clean

After the harvesting of a second bountifull crop of corn, the land was ploughed toward the peach tree rows, leaving a deep water furrow in the centre between the rows,

The proper drainage of any peach orchard is of absolute importance.

The following spring very few dead peach trees had to be removed, All trees were carefully straightened up, The land ploughed and prepaired for an entire change of crops -

Strawberry plants of the following commercial varieties, Beder wood for extra early, Glenmary. Improved Wilson and Williams, were bought and expressed from a Southern climate, in order to have well growen plants before northern plants were ready

Three rows of strawberry plants were planted between each two rows of peach trees, first row four feet from peach row and plants set fiftien inches apart in row
