Prof. Orton gives some little space, in his recent volume on "The Andes and the Amazon," to an account of the con-dor, of which he thinks, contrary to the general opinion of ornithologists, that there are two distinct species. The great condor is the largest of the birds of prey -full-sized males having a height of four feet, and an expanse of wings of about nine feet. A specimen now at Vassar College measures from tip to tip of the wings nine feet. An old male in the Zoological Gardens of London has a stretch of eleven feet; but Humboldt never found one to exceed nine feet, nor Darwin to exceed eight and a half feet; and, from his own observation, Prof. Orton concludes that the largest condors do not go beyond, if they even reach, a spread of twelve feet. The general color of the condor is black, with white upon the wings and at the tip of the bill, and a ruff of downy white feathers encircling the neck. The young birds are dark-brown, and do not assume the white frill and the white feathers in the wings until after the first molting.

Associated with the great condor is a smaller vulture, having brown or ashen plumage, destitute of the white markings distinguishing the larger bird, and withdut the caruncle worn by the male con-dor. This has been by some ornithologists regarded as a distinct species, although the decision is now nearly universal that it is the young condor. In his study of the condor, during his travels in the Andes, Prof. Orton was led to believe that the "condor pardo" and the "condor negro," as the two species are called by the natives, are in fact distinct. They are so considered by several intelligent observers who have had the best opportunities in sojourn and travel in South America for forming a correct judgment. Actual proof is still lacking, and this may be long de-layed, as the inaccessible regions where the bird nests and rears its offspring render a minute study of its life history extremely difficult.

The condor ranges along the west coast

of South America, from the Straits of Magellan to about eight degrees north of the equator. Darwin notes the fact that the hird is found only in the vicinity of perpendicular cliffs, and concludes that its habits require the seclusion and safety of precipitous and lofty crags.

During the greater part of the year the condor frequents the lower country along the coast. It searches for prey at evening or morning rather than at midday, and several perch together at night on the same tree. In the breeding season, which in Chili is in November and December, and in the valley of Quito several months later, the birds retire to inaccessible places in the mountains, and there, on the bare rock, with little or no preparation in the way of a nest, deposit two white eggs three or four inches long.
The period of incubation covers six or seven weeks. The young are covered with down until full grown, and are not able to fly for nearly two years. During their first molting, Prof. Orton states, the birds are in caves and are fed by their elders.

"The ordinary habitation of the royal condor," says Prof. Orton, "is between the altitudes of 10,000 feet and 16,000 feet. The largest seem to make their home around the volcano of Cayambe, which stands exactly on the equator. Flocks are never seen, except around a large carcass. It is often seen singly, soaring at a great height in vast circles. Its flight is slow and majestic. Its head is constantly in motion, as if in search of below; its mouth is kept open and its tail spread. To rise from the ground, it must needs run some distance; then it flaps its wings three or four times, and ascends at a low angle until it reaches a considerable elevation, when it seems to ke a few leisurely us if to ease its wings, after which it leisurely sails upon the air. In walking, the wings trail on the ground, and the head takes a crouching position. It has a very awkward, almost painful gait. From its inability to rise without running, a narrow pen is sufficient to imneison it. Though a carrion-bird, it its time soaring three miles above the sea. Humboldt saw one fly over the Chimborazo. I have seen them sailing, at least, 1,000 feet above the crator of

Pichincha." Darwin writes of the flying powers of this royal bird: "When the condors are wheeling in a flock round and round any spot, their flight is beautiful. Except when rising from the ground, I do not recollect ever having seen one of these birds flap its wings. Near Lima, I watched several, for nearly half an hour, without once taking off my eyes. They moved in large curves, sweeping in circles, descending and ascending without giving a single flap. As they glided close over my head, I intently watched, from an oblique position, the outlines of the separate and great terminal feathers of each wing; and there separate feathers, if there had been the least vibratory movement, would have appeared as if blended together; but they were seen distinct against the blue sky. The head and neck were moved frequently, and appearently with force; and the extended wings seemed to form the fulcrum on which the movements of the neck, body and tail acted. If the bird were for a moment collapsed; and when again expanded, with an altered inclination, the momentum gained by the rapid descent seemed to urge the bird upward with the even and steady movement of a paper kite. In the case of any bird soaring, its motion must be sufficiently rapid, so that the action of the incline surface of its body on the atmosphere may counterbalance its gravity. The force to keep up the momentum of a body moving in a horizontal plane in the air (in which there is so nittle friction) cannot be great, and this force is all that is wanted. The movement of the neck and body of the condor, we suppose, is sufficient for this. However this may be, it is truly wonderful and beautiful to see so great a bird, hour after hour, without any apparent exertion, wheeling and gliding over mountain and river."

The condor gorges itself with food un-tit is incapable of exertion, and then retired to its favorite perch, to remain in a state of stupidity until the process of digestion is completed. Prof. Orton testifies that "its gormandizing power has hardly been overstated. I have

not of the largest size, to make way in one week, with a calf, a sheep and a dog. It prefers carrion, but will sometimes attack live sheep, deet, dogs, etc. The eye and tongue are the favorite parts, and first devoured; next, the intestines. I have never heard of one authenticated case of its carrying off children, nor of its attacking adults, unless

in defense of its eggs."

In captivity, it will eat everything except pork and cooked meat. When full fed, it is exceedingly stupid, and may be caught by the hand; but, at other times, it is a match for the stoutest

There has been much discussion as to the sense with which the condor discovers its prey. Some experiments would seem to show that it is its wonderfully keen vision which enables it to detect from afar the occurrence of carrion; and, again, incidents appear to prove that the sense of smell serves as a guide. Darwin subjected several caged condors to tests which afforded evidence that the sense of smell was less acute than in the case of the dog. The testimony for and against the acute smelling powers of the condor is, as Darwin remarks, very evenly balanced.

A Fastidious Beggar.

He was very gentle in manner, he had a mild blue eye, and a nasal twang, re-lieved by a lisp, charmingly beautiful not to hear. His pull on the bell was gentleness itself; and when Mrs. Spriggs decided to answer the ring she felt certain it was some amiable friend. The "good mornings" were said with a heartiness only to be acquired by a long self-denial and training. "Have you an overcoat, missus? I'm a poor man—a widower with seven small children—five that I have adopted out of pure charity -and I thought I'd drop in and se about a cost.

Mrs. Spriggs' heart moved with pity a widow long, and she joyfully replied:
"Oh, yes! I have one of Mr.
Spriggs', that he had made to order last
March." She felt that she could never stand to be "On! then it is not of the late

style!"
"Oh, no! I'm sorry to say one of those dreadful tramps stole his best.' The man's face flushed up some as he asked: "Buckhorn buttons or gutta

peacha?

"Gutta percha," said Mrs. Spriggs.
"Oh, they have a disagreeable odor."
"Oh, well," said Mrs. Spriggs, noticing his look of disappointment, "it's a very nice coat. I'll run up and get it out of the camphor."

"No, no, you need not. Camphor I detest, and gutta percha buttons! Au revoir, madame," and he passed down the steps, the very picture of grand manhood.

"Inclose Stamp."

For a man who has a large city correspondence and has constitutional objections to paying out his coin to the Federal Government, the following branch of business is picayunishly profitable:
Advertise for a clerk in some daily paper, state that the salary is \$80 per mo.th, and wind up with "inclose stamp." A benevolent looking old party, with "specs" on the bridge of his nose, has adopted that method, and on the first instant secured one hundred and lifty stamps, and no one knows how many more the next day. He thus receives good interest on his fifty-cent investment, and the poor clerks have to pay it. If there is a meaner man in the city let him show up.—San Francisco Chron-

Then and Now.

The following letter from Dr. Oliver Wendell Holmes, written twenty years ago, is quoted to show the difference between the charges of lecturers now and in former days:

WHICH HAS STOOD THE TEST OF 40 WEARS. THERE IS NO SORE IT WILL NOT THEAL. NO LAMMENESS IT WILL NOT CURF, NO ACHE, NO PAIN, THE APPLICAS THE HUMAN SORY OF A PELICAS THE HUMAN SORY OF A PELICAS THE HUMAN SORY OF A PERICAS THE BODY OF A HORSE OR OTHER

"My terms for a lecture, when I stay over night, are these: "Fifteen dollars and expenses, a room with a fire in it, in a public house, and a mattress to sleep on—not a feather bed. As you write in your individual capacity, I tell you at once all my habitual exigencies. I am afraid to sleep in a cold room, I can't sleep on a feather bed, I will not go to private houses, and I have fixed upon the sum mentioned as what it is worth to me to go away for the night to places that cannot pay more."

AT our request, Cragin & Co., Philadelphia, Pa., have promised to send any of our readers gratis (on receipt of 15 cents to pay postage) a sample of Dobbin's Electric soap. Try it. Send at once.

DIFFERENCES in the elements are apt to lead to blows.

Shot-Guns at the Centennial. The display of shot guns in the main building is very fine, and is examined with much interest, daily, by a large number of visitors, interest, daily, by a large number of visitors, desirous of ascertaining which is the best gun for practical use. It is but simple justice to say that Parker Bros., of West Meriden, Conn., received the first premium—Grand Medal and Diploma—for their breech-loading, double-barreled shot-gun, at the Centennial Exhibition. This confirmation of the popular judgment of it, as the best shot-gun in the market, is due to its superior shooting qualities, and to the perfection of its mechanism and workmanship. Its merits are so widely known, and demand for it so general, that a notice of it is of far more interest to those wishing to buy the best shot-gun than to Parker Bros. it is of far more interest to those wishing to buy the best shot-gun than to Parker Bros. The prices range from \$50 to \$300. But their lowest-priced guns are warranted to shoot as well as their highest-priced ones. Their chief salesroom is at 97 Chambers street, New York. For a third of a century the Parker Bros. have been well known as manufacturers of various classes of goods, and during this long period their name has been a guaranty for integrity, feir dealing, superior workmansilp and skill. Ten years' experience in gun-making, with pereistent efforts to make the best gun possible, has crowned their labors with the most signal success, and won for the Parker Gun the reputation of being the best in the world.

A CORRESPONDENT, writing from the Centennial Exposition, tells of the following wonderful feat of CIDER MAKING.

At the Centennial trial of cider machinery in Agricultural Hall, Oct. 26, the Boomer & Boschert Press Co., of Syracuse, N. Y., made 116% barrels of cider in 9% hours, with one press, averaging a barrel of cider from less than 7½ bushels of apples. Thousands witnessed the trial, and expressed their satisfaction with the masterly manner in which the work was performed.

THERE can be no mistake about it. "Matchless" plug tobacco takes the lead. Old fine-cut chewers say it gives better satisfaction and is cheaper than fine-cut. You caunot be imposed upon, as each plug has the words "Match-less P. T. Co." on a wooden tag. Try it once and you will always chew it. Manufactured by known a single condor," he relates, the Pioneer Tobacco Company, New York.

Among the novelties exhibited in Agricultural Hall, Philadelphia Exposition, we a new cereal, weighing 60 pounds to the bushel, as easily grown as corn, and more productive, excellent for table use, for stock and fowls. It is of South American origin, but has been acclimated in the State of Michigan since 1872, where it produced from 75 to 150 bushels an acre, and will ripen where corn will ripen. Its stalk the leaves resemble corn, it is planted three or four feet apart, six to either ternels in a hill, grows seven or eight feet high, the kernels being in a cluster, seven or eight inches long, at the end of the stalk, which curls over and hangs down like the top of a seed onion. The kernel is a little larger and rounder than rice, which it much resembles. It appears to be a very describle addition to the cereals of the North, and is to be sold only in small packages, with cut of grain on each package, and sent by mail, to prevent imposition. It is called Among the novelties exhibited in Agricultural

PAMPAS, OR UPLAND RICE. C. B. Kress, of Jackson, Mich., grower and sole proprietor, will send, post-paid, to any address, sufficient to produce one bushel for 50 cents, or three packages for \$1.00.

BURNETT'S FLAVORING EXTRACTS.-The superiority of these extracts consists in their perfect purity and great a rength. They are warranted free from the poisonous oils and scids which enter into the composition of many of the factitious fruit flavors now in the market.

CHAPPED hands, face, pumples, ring-worm, saltrheum, and other cutaneous affec-tions cured, and rough skin made soft and smooth by using Jamper Tar Shap. Be care-ful to get only that made by Caswell, Hazard & Co., New York, as there are many imitations made with common tar, all of which are worth-less.

In consequence of the many inferior mitations, the manufacturers of the celebrated "Matchless" brand of plug tobacco have been compelled to protect themselves by a trade mark. Every plug now has the words "Matchless P. T. Co." thereon. The Pioneer Tobacco Co., 124 Water st., N.Y., are the manufacturers.

COLLINS' VOLTAIC PLASTER is a gentle and constant Electric Battery closely and con-tinuously applied to the skin by the adhesion of the Plaster, and is capable at all times of afford-ing the most grateful, relief in Rheumatism, Neuralgia and Sciatica.

A case of chronic rheumatism of unusual severity, cured by Johnson's Anodyne Liniment, is noticed by one of our sexchanges. A large bunch came out pour the breast of the sufferer, and appeared like part of the breast bone. Used internally and externally.

THE sweetest word in our language is health. At the first indication of disease, use well known and approved remedies. For dyspepsia or indigestion, use Parsons' Purgative Pills. For coughs, colds, sore or lame stomach, use Johnson's Anodyne Liniment.

A Youth's Publication.—For half a century the Youth's Companion, of Boston, has been published. It was started in 1827, and is to-day one of the brightest and most vigorous papers with which we are acquainted.

The Sunday School Times, of which H. Clay Trumbull and George A. Peltz are editors, and John Wansmaker is publisher, will, in 1877, contain critical notes on the International lessons, by Profs. Tayler Lews and A. C. Kendrick; a popular exposition of the lessons every week, by the Rev. Newman Hall, of London; and a practical application of the lesson truths, by H. Clay Trumbull. This plan secures fuller and better lesson helps than can be obtained elsewhere. The Times is sent to new subscribers, three months on trial, for 25 cents; one year, 2.15.

For seven cents there will be sent a specimen copy of the Scholars' Quarterly, the best Sunday school lesson help for scholars published.

Specimens of the Weekly Lesson Leaf sent free. The most complete leaf of any; although it is sold at so low a price. Address,
