Ayer's Sarsaparilla.

The Victoria Warder

FRIDAY, FEBRUARY 28, 1890. BARLEY.

By WM. SAUNDERS, F. R.S C., F.L.R., F.C.S. Director Dominion Reportmental Farms.

Continued from last week. The stimulus which this activity and large expenditure is giving to agriculture among our neighbors, will no doubt, result in improved methods in farming, and increased returns to the nation, and they are montioned in this connection mainly for the purpose of impressing up-on Canadian farmers the fact, that spart from the question of the use of substitutes for barler, which is probably the main cance of the present depressed condition of the barley market—it is not likely that of the barley market—it is not likely that the the United States will long continue to be so largely dependent on Canada for good and one equal irregular and later ripendate. Hone it is important that our farmers bestir themselves, and by bringing in ore skill to bear on their work, growing those crops which are best stited on giving the plants a good etart at the outset. Experiments have shown that selected, extra heavy seed, has produced nearly three times the weight of seed, make the most of the levitle soil and good chimate with which they are favored. It is not to be expected that malting barley of high quality can be grown in every p rt of Canada; many districts will not doubt, be. found where it will strict a greater degree of perfection than it others. This has been the experiments have above ground to be expected that the blade appears above ground to the late and there, are held to be possibly adapted for barley;

Associately in and antisted effort.

SIX-ROWED BARLEY.

The six-rowed barleys are often spoken on the tis said, varieties of in-rowed; there are, it is said, varieties of in-rowed; there are, it is ead, varieties of in-rowed the loss of good as on our little Sungar. The selection of good etart at the outset. Experiments have shown that the varieties of in-rowed barleys are found about form light selecting good that which they are the varieties of six-rowed barleys and vigor are found similar to those among the varieties of six-rowed barleys in cultivariety, sending on the average of about four, remaining the plants a good etart and the loss of good as on our little Sungar.

The six-rowed barleys are often spoken of as foun-rowed; there are, it is eaid, varieties of in-rowed; there are, it is eaid, varieties of in-rowed barleys in cultivariety in Scotland, but none of these favored, the varieties of six-rowed barleys and vigor are found similar to those among the varieties of six-rowed barleys differences as to relative fertility and vigor are found similar to those and vigor are found simila held to be specially adapted for barley; aimilar experience has also been had on the confinent of Enrops. The only way to ascertain where specially favourable conditions exist, is by testing this grain in every promising locality, noting the routils and reparing the tests until entering the test until entering the tests Scient facts are available on which to

From Assiniboine Reserve N.W
T. (grown by Indian named
Rabbit Skin.) TWO HOWED BARLEY IN DENMARK. In proof of what may be done to improve the baries erop of a country, the case of Denmark, now a large exporter of malring before to Great Britain may be on it. In a recent number of the Journal of the Royal Agricultural Society of England, is a paper on barley from a maliater's point of view, by Robert Free, in which he says! "Only a few years ago the barley protection of Denmark was practically confined to a coarse thick-skinner a three grain, suitable only for skinned netwo grain, suitable only for distilling or grinding, and the change is mainly due to the energetic scion of the Danish Royal Agricul aral Society with the assistance of the Government. In

the freezing and storing, and the practical fraction for the whole has been to revolution as this brauch of agriculture in Denma k, the annual money outlay, be it observed, amounting to no more than 2800. It is now estimated that one-third of the arable land in Denmark is devoted to harley outlay, and the total yield is at m 2760.000 quarters.

The previous of harley outlays.

The previous outlay held by farmers in Grant Britten that lead to be used for harly gowing should be prepared beforestant by manufaction of barny and memore to a crop which remains on the land or short a time as barley does, is not lively to practice existactory results. The roots of barley grow rapidly but do not aritic deep; they are compared to the other hand, it is important aging.

On the other hand, it is important aging the office, that by laws would adjourned at 2.15.

Burdock Pills our sick headadie by requirements to straw rather than to grain.

ured, rarely gives crops as good as can be obtained with less fertilizing from good

on the other hand, a wet soil is devi-mental, and land for barley-growing should be well drained. A light, rich, friable loam is generally regarded as the most suitable soil for barley, although it does well on a clay loam if thoroughly worked until it is reduced to a fine mellow condition. A well pulverized and clean seed bed is all important. Barley

chould at first be turned over every few days, otherwise the moisture in the grain may result in its acquiring an earthy flavor, which will greatly injure it. Before being marketed the grain should be thoroughly cleaned and put through the fauning mill often enough to blow out and separate all the light and broken grains; and all admixture with foreign seeds should be carefully avoided; a good, always elses ample commands a higher plump, clean sample commands a higher price, and a readier sale, and the light grain separated can be profitably used as feed.

low condition. A well pulverized and clean seed bed is all important. Barley is said to do best in a warm, dry atmosphere with occasional light showers; a free circulation of air and plenty of light are also essential conditions to success. The questions of admission of light and circulation of air have an important bearing on thick seeding; the width between the rows and the direction in which the rows should run also require further and frequent tests. Weeds probably do more harm to such crops by the exclusion of light and air than from what they take in the way of nourishment from the soil. Early sowing is also much favored, sowing as a soon as the ground is dry enough to be well pulverized. This is said to counterset the tendency to over luxuriance, which sometimes injures the crop in rich soils. When drilled, two bushels of seed to the acre is commonly used; some farmers use less, but a full allowance of seed prevente excessive tillering and consequent irregular and later ripering.

The selection of good, plump seed canting the selection of good plump seed canting the selection of good, plump seed canting the selection of good plump seed canting the It is believed that two rowed barley

soial to The Warder. Business. - During the past few weeks

our town in the vicinity of the lake and railway station has been a scene of unusual interest and excitement. Three or four companies of ice dealers from Toronto are busily engaged in shipping ice to the many teams employed to haul to the cars. No serious secident occurred nutil last Saturday morning, when Mr. O. Raimes' horses and sleigh broke through the ice and discounted With Mr. McDonnell's Block.

we understand that the companies and some of his friends have given enough to fully make up the loss of the team. In the middle of the afternoon, another sleigh broke through the ice, but fortunately the borses were saved. This so frightened the other teamsters that operations had to cease for that day. On Sunday the ice got quite safe again, and on the i llowing day work was resumed with renewed

On the 7th inst., smoke was seen issuing from the roof of Dr. Hamil's office, and being hushed on by the north wind was making great headway. But the first toll of the fire bell warned the fire brigade and in a short time two steady streams were applied which soon stopped
