We are told by professor Oliver Lodge, the celebrated physicist, that at the absolute zero of temperature,-373 deg. C., or 459 deg. F.—the molecules of a perfect gas would lie so inert that they could be swept together in piles on the

In a recent London lawsuit regarding noise and vibration caused by a factory, the phonograph was brought in as a witness, at the suggestion of Prof. Silvanus P. Thompson, being caused to record the noises and reproduce them in court.

The Italian consul at Bordeaux has telephonie connection with the opera house at Bordeaux as well as with that in Paris, and he says he heard the music from Paris, 375 miles, as distinctly as that which comes to him from a distance of only a few blocks.

Air can be frozen at a temperature of 296 degrees below zero, and the product, which can be handled and felt, burns, -so to speak, with its excessive cold. Frozen air can be produced in any quantity, but its cost, \$500 a gallon, is likely to prevent a large business.

Electricity is employed largely for pulling teeth. To the battery are attached three wires. Two of them have handles at the end, while the third is attached to the forceps. The patientgrasps the handles, the electricity is turned on suddenly and the deutist simultaneously applies his forcers to the tooth. The instant the tooth is touched, it, as well as the surrounding parts, becomes insensible to pain. A jerk, and it is out.

Electricity has won many triumphs over its once formidable rival, steam, during the past decade, and that, too, in departments in which the position of the latter was deemed unassailable. As a source of intense light, and as a motor force for vehicles, as well as for machinery of all kinds, it is in extensive use and in steadily growing demand; and now attempts are made to utilize electricity for heating purposes.

An interesting and important experiment was lately conducted by Dr. Palermo at Naples. In the course of scientific studies Dr. Palermo has given pecial attention to the relative action of sunshine and darkness on microbes. He claims that his researches have proven that in addition to checking the multiplication of micro organisms, sunlight is especially baneful to those which are noxious to human or animal life. In the experiment mentioned Dr. Palern.o exposed the bacilli of Asiatic cholera to the sunlight for four hours, and finding them still alive, he administered them to a guinea pig. Taking at the same time other germs of a similar nature which had been kept in a dark room for an equal time, he administered them to another guinea pig. In about 8 hours the latter animal died of Asiatic cholera, while the former charged with the suncured bacilli remained perfectly well. Subsequently the doctor inoculated the animal with the most virulent cholera microbes, but they had no effect upon it; exposure to the sun's rays had, besides destroying the disease producing powers of the microbes, made them active and effective agents in resisting their still virulent brethren.

A Fish With a Lantern.

No matter what animals, or group of animals, are studied, it will always be found that their leading physical traits are exactly adapted to their habits and conditions. A striking illustration of this fact is afforded by the torch fish. This is a deep sea fish, that carries on its nose something like a short, thin, bone, which it can illuminate with a phosphorescent light, or extinguish at pleasure. It does not use this lantern to guide it on its way in the depth of the ocean, or to enable it to see what is going on in the neighborhood; the light is put to a more practical use. When the fish feels hungry, it lights up to attract smaller fish. They dart for the light and find themselves in the capacious mouth of the fish. How the lantern is lighted and extinguished is not yet clearly understood.

Crow Catching in India.

In order to catch crows after the gypsy fashion in India, it is necessary to have a captive crow always on hand. This crow must be laid upon its back and its wings pegged to the earth with forked sticks. Immediately a free crow will attack it, and the captive crow, seizing the free one with its claws, will hold it tight. Crow No. 2 must then be taken and pegged down also. Other crows will come and two more will soon be caught. They must also be laid out with pegs, and then the four captives will take four other crows. This plan is followed until the hunter has taken all the crows he desires.

The smallest bird in the world is an Kast Indian humming-bird. It is a little larger than the common house fly,
