NEW YEAR'S RESOLVES.

t stock-taking time, whenever that may be, the merchant invariably ponder long and deeply over the events of the business year-if fairly successful he should understand what has contributed to that success in order to gain an increase of prosperity; if there have been losses, he must trace the cause to be able to stop the leak.

We have just finished the work of taking stock, and the result of our cogitations over the past season's business will bear fruit during the new year. We have reason to be deeply thankful to our many patrons for the vety large trade enjoyed and our gratitude is sincere.

As to our resolves for the next year entered upon: They are in a sense business secrets, and cannot be divulged. It will suffice our many patrons to know that no effort will be spared to give them better service, the highest grade of goods, and wherever possible educe the price to the lowest living figure. Our guiding principle in the past has always been "Small profits and rapid turn-over of Stock," and it stays—it has worked to the satisfaction of our customers.

We invite families who have not tried us for their wants in our line to give us a trial, satisfied that we can do better than others by a good many dollars in a year's trading.

Make this resolve—it will be a good start for the new year.

ERIE MEDICAL CO.,

A novel style of metal pole for overhead electrical construction, from which many

of the difficulties and objections attending the use of wooden or iron poles are entirely absent, has been designed by a Wisconsin inventor. The construction of this pole is simple and extremely ingenious. A framework is made of three strips of steel, Tshaped, held apart in the form of a triangle by steel girders or braces fixed about every six feet, the three steel uprights being laced together by means of a continuous steel wire threaded through holes bored at regular intervals in the projection of the T-shaped strips. The skeleton standard made in this manner is strong, light and rigid, and, as will be seen by our illus-

SKELETON STEEL ELECTRIC POLE

tration, presents a not unsightly appearance. At the base the three uprights are stayed about eighteen inches apart, gradually taper upward until they are about six all strange in the or seven inches apart at the top. The wire lacing as before stated, is in one continuous length, and serves as a ladder by which the linemen can mount the pole.

These poles are made of any length up to sixty feet. A forty-foot pole weighs only 300 pounds. - Electricity.

Brown Paper Made of Dirt, The Refuse Disposal Company, Limited, dress. The ankles are in London, is engaged in the manufacture amply protected by of paper from the contents of the dust bin, the boots, and there of which 3 per cent. at least is paper and is no disturbing daub of mud a disfigure rags, besides quite a quantity of straw and the skirt. -Boston Herald. other rough material.

The process is thus described: The dust on its arrival at the works is shot into a three years. FREE from ALL RESTRICTIONS large revolving riddle having a three-inch mesh through which the heavier and smaller matter finds its way, while the paper rags, larger bottles, tins, etc., are received at the delivery end of the riddle, and are duly sorted by hand. The heavier materials which pass through this riddle are received on a travelling band and elevated to a second riddle having a one and a half-inch mesh ; at the delivery end of this second riddle an air blast blows the lighter material away from the heavier; the lighter portion principally consists of material suitable for making rough paper; the heavier is automatically delivered on to a revolving table, where it is overlooked by boys, who separate the bones, glass, etc., while the clinkers and organic mat-

ter are ground up in a kollergang. This ground material is sent out from the works for manure. The heavier and and-half-inch mesh of the second riddle are again received on a travelling band and mechanically sifted through a half-inch mesh which divides them into two qualitiesashes, which are automatically delivered into barges, and "breeze." This "breeze" consists to a great extent of small pieces of coal and other organic material, and is used by the company as fuel, being burned in

To prevent any disagreeable smell, the drafts for the fires is obtained by exhausting with a fan and the products of combustion passed through an ordinary "scruba common brown casing paper on the pre- run."

Never was a paper-mill with a 60-inch machine got into a smaller space. The company are now making about fifteen hundred pounds of brown paper in twelve
