for hatching there was a period of continuous rain for many days. One morning I saw her about with chicks in the rain, and I went to her nest. She had left two chicks in the nest to die, either never hatched or drowned with rain. They were drowned with rain anyway, and both seemed to be close to death. I took them both into the kitchen, dried and warmed them. One died in about an hour. One lived and became a remarkable layer. Nobody must tell me anything about any dependence on hens in general because of their instincts after this result and piles of others that have come under my notice.

I rather expect chick number one to die, and want to tell you the reason of its death from actual examination rather than to tell it now. I expect chick number two to live and thrive. Therefore this article must be continued next month.
