LINDSAY

The Management of the Dairy Herd

An Outline of the Address Delivered by Mr. Henry Glendenning at the Recent Meeting of the E.O.D.A. in Lindsay—Practical Facts by a Practical Dairyman.

Table with columns: Dry matter, Ash, Protein, Carbo-hydrates, Nutritive ratio. Lists various feeds like Wheat, Barley, Oats, etc.

There are seasons of the year when the management of the dairy herd is reduced to a minimum. Especially is this true in June, when the cows are turned out to pasture with plenty of sweet, nutritious grass, and a running stream of pure water in the field.

care of the cows requires the greatest skill to get the best results from the animals from the amount of food consumed. June being the ideal month of the year for the production of milk, we should get as near those conditions as possible.

The cows should be fed a proper ration. It should be bulky, palatable, succulent, and free from objectionable flavors that would affect the milk. It should contain the proper nutrients for the production of milk, and it should be cheap.

Protein (or nitrogenous materials) is the name of a collection of compounds, containing nitrogen. Protein furnishes the material for the lean flesh, blood, skin, muscles, tendons, nerves, hair, horns, wool, etc.

Put (ether extract) is an impure product and includes, besides real fat or oils such as linsed or cottonseed oils, wax and the green coloring matter of plants.

The Nutritive Ratio is the relation that the protein bears to the digestible carbohydrates and fats combined. When feeding a full ration to animals (say for the production of milk) under summer conditions of temperature and not too much exercise being given, requires about one part of protein to 5 1/2 parts of the carbohydrates.

Mr. Mortimer, who is stationed at Collingwood, gives four half days in each week to a small class in the college on agriculture. In addition to this he has attended public school for the purpose of interesting those in attendance in the teaching of agriculture in the public schools.

REPORTS OF THE AGRICULTURAL EXPERTS WHAT THE SIX NEWLY APPOINTED TEACHERS OF AGRICULTURE ARE DOING IN AND OUT OF THE HIGH SCHOOLS.

Speaking of the reports of the six teachers of agriculture in the High Schools of Ontario, the Farmers' Sun says: Bearing directly along this same general line were the reports made by the half dozen agricultural specialists who have during the course of this year been attached to the staffs of six colleges located in different parts of the Province.

The first column represents the dry matter that the food contains, the balance being water. All food stuffs contain water. The amount varies from eight to fifteen pounds per one hundred pounds in such dry material as hay, straw and grain, and from sixty to ninety pounds in the digestible nutrients of feeding stuffs.

Protein (or nitrogenous materials) is the name of a collection of compounds, containing nitrogen. Protein furnishes the material for the lean flesh, blood, skin, muscles, tendons, nerves, hair, horns, wool, etc.

Put (ether extract) is an impure product and includes, besides real fat or oils such as linsed or cottonseed oils, wax and the green coloring matter of plants.

there were sixty in attendance. He has held stock judging demonstrations at different farms at which the average attendance was thirty-five, and has a small class in the college in which instruction is given in botany as well as agriculture.

Abbie Ben Adams, may her life be spared, awoke one night and felt a trifle scared. For on her shirt waist box, cross-legged, sat a Vision writing on a little slate.

Here's a Suggestion!!

Perhaps if you tried you could get the family all together on Xmas or New Year's Day and have your family group picture at my studio. You would never regret it.
