## The Danger Zone for Many Is Coffee Drinking

Some people find it wise to quit coffee when their nerves begin to "act up."

The easy way nowadays is to switch to

# Instant Postum

Nothing in pleasure is missed by the change, and greater comfort follows as the nerves rebuild.

Postum is economical to both health and purse.

There's a Reason"

Young Trees Are Particularly Susceptible to Injury-Kerosene Emulsion is Best Remedy.

The woolly aphis is worse in some parts of the country than in others. It attacks both the branches and the oots, and either dwarfs or destroys the tree. Young trees in nursery or orchard are particularly susceptible to injury. Kerosene emulsion is the best remedy so far offered.

Take one-half pound of laundry soap, two gallons of kerosege and one gallon of water. Dissolve the soap in the full amount of water, and when this solution is boiling hot, remove from the fire and add the kerosene. Stir the mixture violently by driving it through a force pump back into the vessel until it becomes a creamy mass that will not separate. This requires from five to ten minutes.

This stock solution is diluted with nine parts of water for spraying. When the aphis attacks the roots, the earth should be scraped away to a depth of several inches around the tree, and kerosene emulsion used lib-Another excellent remedy for the root ately with better ones," is the message form is tobacco. Spread the stems thick over the roots and cover with

With Set of Knife Blades Arranged Near Top.

Instead of wasting time in climbing trees to pick fruit, George J. Fallkin of San Jose, Ill., gathers his fruit while standing on the ground. He simply a shortage of ment animals throughout tate changes in many feeding formulas uses a long cutter-pole having a metal | the world, we cannot hope to import | and stockmen are urged to apply at cup mounted on its end. well inside the cup. A string is then pulled. This causes the sharp cutting blades to sever the stem of the fruit. The fruit falls into the cup, the bottom of which opens out under the weight of the fruit and allows h to drop don a through an opening and into a long cloth sleeve. When the sleeve is filled up, the fruit is dumped into a pail or basket. By this method there is no danger of bursting choice fruit and thus decreasing its market value and keeping quality .-- Popular Science

#### CLEAR WEATHER FOR FRUITS

If Conditions Are Right Bees Are Active and Cross-Pollination Proceeds Rapidly.

It is a well-known fact among the hest fruit growers that the weather conditions during fruit bloom has much to do with the setting of the fruit. If the weather is clear and warm at blooming time the bees are active and cross-pollination proceeds rapidly, while if the weather conditions are wet, cloudy and cold the insects are not active and usually a poor set of fruit is secured. Strong cold winds may often prevent the bees from cross-pollinating one side of the apple trees and this may account for the set of fruit on only one side of the trees.

### **BRACE IN CHERRY BRANCHES**

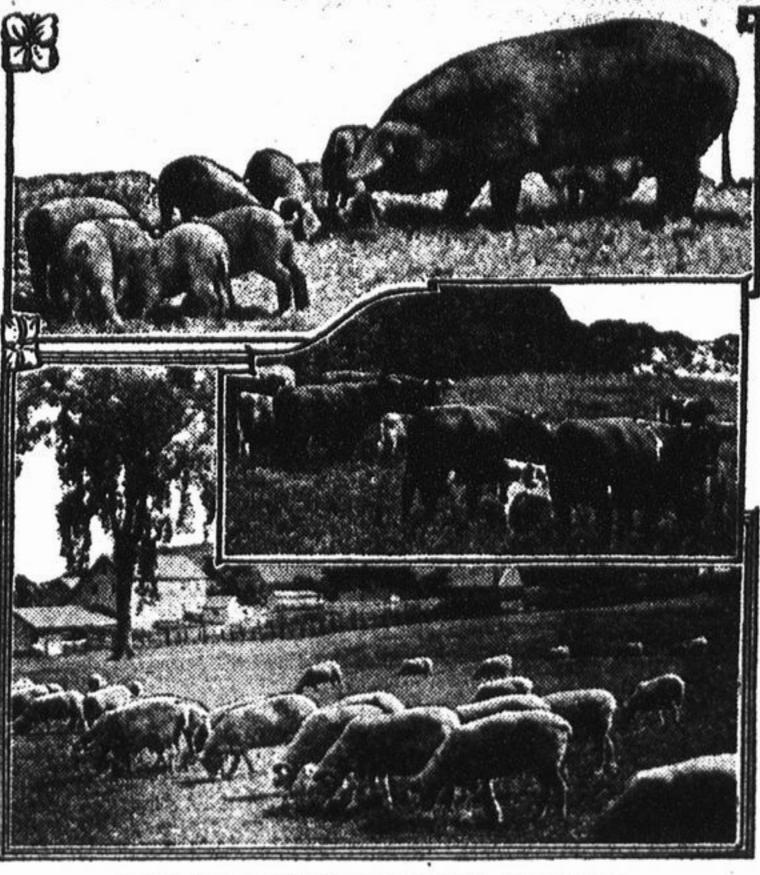

Before Picking Set Ladders Straight as Possible and Place Gas Pipe for Rest.

Branches of old cherry trees are very brittle and break easily if a little extra load is put upon them. Before setting the picking ladders lash the larger branches together with ropes. Set the ladders as straight as possible and place a piece of gas pipe between two or more branches for the ladder to rest against.

Year Is Wasted. A year wasted in the life of a fruit tree is gone forever. No amount of later care can make up for neglect or delay in setting trees.

Shrubs Worth Planting. Shrubs that attract birds by their fruit are worth planting, around the farm home.

Take Out Dead Wood. Go over the orchard and lawn tree and take out all dead wood and other needed pruning.

#### **GREEN ALFALFA IS** CAUSE OF BLOATING

Full Feed of Hay Before Turning Them on Pasture.

CBy R. H. WILLIAMS, Animal Husbandman, University of Arizona.)

Cattle and sheep are very susceptlble to injuries from bloat when pastured on alfalfa. Extra cure is necessary to avoid deaths, and many times not a few animals will die in spite always wise to give animals a full feed of alfalfa hay, corn fodder or other ford before turning them out on alfaifa pasture. The alfalfa should feeding tests with various roughages, be fairly well matured, and of a dark green color, for it is the light green is generally appreciated by lamb feedgrazed the field down, leaving noth- finishing lambs. On most farms, how-After being left on such a pasture desirable to utilize in the feeding opfor a while they may be graduated erations. There are years when to other fields with more alfalfa. legumes are a partial or total failure, Supplying the animals with alfalfa or not enough legumes may be raised hay or other dry food along with the to feed as many himbs as desired. In alfalfa will also have a good effect in such cases timothy hay, out straw of checking the bloat.

Since the new shorts are the portions of the plant which cause bloating, it is wise to turn animals into an alfalfa field only a few minutes for the first time, ten minutes probably sufficient, and not than twenty minutes at a time the first week. After this time period may be lengthened and animals allowed to graze at will. will thus be necessary to turn the stock into the field two or three times a day, and they should taken off before they begin to bloat By allowing some of the animals to graze over a fresh area and secure small amount of heads and turn them back onto the main stems little bloat will result. This is probably one of the best wars of preventing the

It has been found that moving and mals around and compelling them to exercise relieves those somewhat that are suffering from bloat. A dose of formaline, consisting of 40 cc (or three tablespoonfuls), for a mature steer, or one-fourth of this amount for a calf, has a specific effect in relieving the formation of gas in the stomach. Some run a rubber hose the gas is liberated through it. stagger and be almost ready to fall. below and in front of the hip bone.

No Place for Grain Crops.

### FEEDING LAMBS ON **CORN AND LEGUMES**

Always Wise to Give Live Stock Expert of Ohio Station Gives Results Secured in Feeding Various Roughages.

"When the same grain ration was ted, no matter whether the grain consisted of corn alone or of corn and linseed ment, the lambs fed clover or alfalfa made larger gains, required less feed per pound of gain and produced gains at a lower cost for feed of the greatest care possible. It is than did those given either out straw or corn stover," said L. W. Hammond of the Ohio experiment station in discussing the results secured in his lamb-

"The value of leguminous roughages ulfaifs which causes blest. Animals ers; and most of them know that so that have not been accustomed to far as efficiency is concerned clover nifalfa should follow those having and alfalfa hay are unsurpassed for corn stover are fed.

"These non-leguminous feeds, however, did not prove satisfactory sole ronglinges for fattening lambs in the feeding tests conducted at the experiment station. They may be used in the carlier part of a long feeding period, provided the lambs are finished on a more efficient roughage like clover or alfalfa, or they may be used as a part of the roughage.

"Such feeds as timothy hay, oat straw and corn stover are low in protein, and should be supplemented with a high-protein feed like linseed meal. In the feeding trials mentioned above the addition of liuseed meal to corn and either out straw or corn stover resuited in larger and cheaper gains and higher finish on the lambs. Still, the gains made by these lambs were more costly than those produced by clover or alfalfa."

#### ORCHARDS RESPOND TO CARE

Fact Demonstrated Repeatedly, Yet Farmers Expect to Get Fruit Without Any Attention,

That orchards respond to care has been demonstrated repeatedly. In down the throat into the paunch and spite of this fact, however, many farmers expect their trees to bear fruit small teacupful of kerosene and one- without any attention whatever. It is half pint of sweet milk is also a just as important to care for trees as good specific for this trouble. A it is for animals. A highly productive small amount of turpentine in this tree is no more capable of shifting for mixture would also facilitate relief. Itself and competing with its enemies When an animal is so far gone as to than an animal, yet farmers will take better care of their live stock than they It will be wise to use the trocar and do of their trees, simply because they canula, by puncturing the rumen just | can more readily see the effect of neglect or an animal than on a tree.

# **VENTILATION OF DAIRY BARN**

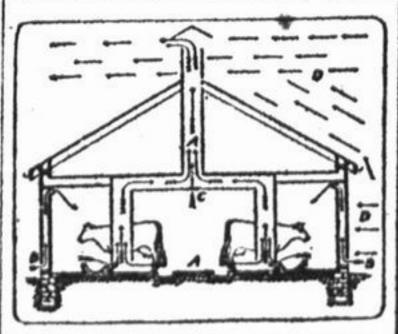

Better Health of Animals to Assured by Supply of Fresh Air-King System Described.

More of us every year are building barns with ventilating flues or putting flues into stables already built. Fresh air means better health in herds. The system described by F. H. King,

the Wisconsin authority on ventilation, never has been outclassed. It is the natural way.

In illustration, the movement of the air is shown by arrows. The pure air comes in above the animals and the foul air is taken out through the outtake shafts which have their openings down near the floor and extend up through the roof or to the cupola, Some builders run the shafts straight up through the roof, others run them up to the roof and then over to the cupola, and some join the lower shafts at the ceiling and then use but one main shaft to the roof at each end as shown here,

The galvanized metal shaft is preferred by most dairymen who have used this sort of ventilating system.

Air Pressure is Shown at D. D. Fore ing Air in at B. B., and Out by Suction at Top of Shaft A.

A general rule seems to be well tried out that thirty square inches of outtake and intake area are about right for each grown animal housed in the stable. This being true, there would be needed two shafts, each 10 by 15 for a herd of ten cows. The intake openings should be of the same area. A damper in the ceiling at C can be opened if the temperature of the stable grows too warm. There can be no regular circulation unless there are as many and as large intakes as outtakes. Also, the intakes should let the nir in at the ceiling, or above the level of the lower openings in the outtakes or foul uir shafts.

#### HANDLING MILK IN SUMMER

Whether Intended for Table, Cream ery or Market, It Must Be Sweet to Bring Seat Price.

It is no trick at all to keep milk sweet to cold weather. It may stay in the sun half a day in December without any damage, but in June and July it must be handled very carefully. Whether the milk or cream is intended for the table, the creamery, or the milk market, it must be sweet | America. if it is to bring the best price,

To keep milk sweet just two simple things must be very enrefully looked after: (1) it must be cooled as completely and quickly after milking as possible, and (2) absolute cleanliness of palls, pans, and cows must be secured. If this is done, thunderstorms will no longer sour the milk. The warm, damp wenther which we have just before thunderstorms really ing but the coarse woody stems and ever, there are always such roughages does tend to cause milk to sour if it has not been properly cared for.

This souring takes place because litthe invisible plants called bacteria get into it in dirt or by lurking in the corners and seams of poorly cleaned pails and cans. The remedy is plain. Keep the bacteria out by using seamless palls and caus and seeing that absolately no diet or dust gets into the milk in the stable or anywhere else.

#### DAIRY PRODUCTS IN DEMAND

Impossible to Buy First-Class Dalry Cows at \$80 Per Head-Breed Up the Common Stock.

The great demand for dairy prodnots has caused the price of good dairy cows to be very high. Reports from associations of dairymen show that it is impossible to buy first-class dairy cows at even \$90 a head. With such a demand for cows in old dairy districts, there will be few good cows moved into new dairy territory. the only way new districts can be supplied must be by breeding up the common stock by the use of good dairybred bulls.

#### ALFALFA FAVORED FOR COWS

Amount of Protein Necessary to Feed In Form of Expensive Concentrates is Reduced.

(By PROF. J. C. KENDALL) Where alfalfa is available for dairy cows the amount of protein that is necessary to feed in the form of expensive concentrates is materially and profitably reduced. For cows that do not give large yields of milk, a balanced ration can be made by feeding alfalfa hay and ensliage. This makes a home-grown ration that can be produced cheaply, a very important factor in the economical production of datry products.

Everything Clean.

Everything about the calf should be acrupulously clean. Milk from infected cows or from a creamery should be pasteurized before it is fed.

Cause of Calf Diseases. Calf diseases are largely the result of filth and carelessness. Prevention

Psychology and the War.

Prof. G. Stanley Hall of the Clark university, United States, places the subject of applied psychology on A high plane in relation to the war. He

"Whatever system has been employed, it is evident that applied psychology has produced results in this war which it was never possible to attain before. Men have endured more, they have shown more heroism and daring and have submitted to more punishment than in any previous war. No such slaughter would have been possible in former wars without provoking a panie. This has unquestionably been due to the system of psychological selection, not only for the various grades of service but for special activities within each grade. Our country may as well think of going to war without first-class military equipment as without a knowledge of applied psychology. The council of national defense seems to have ecognized this; and the National Research council within that body will, I understand, contain representative
