

Air exhaust grilles are located above the coat recesses in the corridor, so that the air exhausted through these grilles passes over the hanging clothes taking with it any dampness and stale odours.

The complete heating and ventilating system is controlled by a timer that automatically lowers the building temperature and stops all exhaust fans at night, when classes are not being held. Early in the morning this automatic control will return the rooms to their pre-set temperature required for occupancy and also starts the exhaust fans. On weekends the system runs as for the night sequence.

The Heating and Ventilating system is completely automatic and will run continuously without supervision. Any or all classrooms may be used in the evening or on weekends by the operation of a manual switch.

All washrooms are exhausted by motorized fans.

ELECTRICAL

Fluorescent lighting is utilized throughout the building. Classrooms have maintained lighting level of 75-foot candles at desk level.

The entire building is protected by a manual fire alarm system with automatic fire detection in unsupervised areas.

All teaching rooms are connected with the intercommunication system controlled from the Principal's Office.

The programme bell system is automatic.

Exterior lighting is controlled by clock timers.
