NOTES AND COMMENTS

It is said the international conference which is to settle all differences and entanglements between the Dominion and the United States to meet at Quebec some time in August. We notice the name of Mr. John Charlton has been left off the list of Canadian Commissioners and those retained are Sir Wilfrid Laurier, Sir Richard Cartwright and Sir Louis Davies. Should the Commission succeed in arranging matters that will satisfy the Washington Senate and our own parliament, it will deserve memorial medals for all its members and also the gratitude of the Empire and the Republic. Uncle Sam must repress his propensity to claim all he sees or the conference will be a failure.

The mineral wealth of this Dominion is one of its most astonishing possessions. While its forests, its agricultural products and its fisheries are valuable beyond calculation, its rocks contain untold treasures which if not wasted, and given away, will be rich inheritance for the generations of coming centuries. The Spanish-American war tested that mickle steel-armored ship armament super-superior to that armor. All nations with men and want it. Canada possesses it in greater measure than any other country. Practically she has it all. The manufacture of nickel plate in this country will establish a wondrously valuable industry. It rests with the government whether this wealth shall enrich the people of Canada or those of the United States and other countries. The iron and steel that large deposits of iron and steel have been located in the township of Carlow in the eastern part of Ontario, another mineral wealth that our mineral wealth is beyond question.

Another factor has been introduced into the discussion of home work and its general education of children. The brain fatigue, so much complained of, is said to be due to the lack of brain nutrition brought on by lack of the proper food for its due nourishment. The brain of children needs special food for building it up, which the sweet, but too frequently feed on, do not furnish. The children of well-to-do parents who could get whatever food is necessary for their children, are in no better position than the children of the poor, who cannot get it. Ignorance of what is necessary in the one case is balanced by poverty in the other. This we have another subject to deal with.

The then and now of medicine is a very curious subject of study and shows that what is called science today may be error tomorrow. The monstrous claims of the Ontario medical council which the legislature has clothed with unusual powers, direct attention to what is called the science of medicine and also to what is called science generally. The evolution of the so-called science of medicine from the days of Hippocrates to our own day demonstrate its uncertainty and its utter infidelity as a science. In Gil Blas the doctor bled all maladies by bleeding the patient and making him drink hot water. We laugh at that as the vagary of a doctor in fiction, but as late as the sixties, Doctor Payne, professor in the University of New York, taught that all human diseases would yield to blood letting and tartarized antimony. Was that any better than Dr. Sanguin's method? Some of the remedies for the bite of a mad dog, other days are curious as proofs what science has been. Some of these are the dried liver of a dog, hawk in wine, hyena's liver and the liver of a pug, a field mouse's tail, burned and beaten in dust was mixed to be eaten. But this would not do it, the tail had been cut off while the mouse was alive. The gall of a bear steeped in water was to be taken after the patient had fasted three days. Another remedy was a snake's skin and a mud crab pounded together. Molluscs would be needed to show the changes of treatment of diseases down the centuries and the changes still go on. That sort of thing is called science.

Painless Extraction

A bit of homesurgery practiced when a splinter runs into a child's hand painlessly deep is extraction by steam. A bottle with a sufficiently wide mouth is filled two-thirds with very hot water, and the mouth is placed under the injured spot. The suction draws the flesh down when a little pressure is used and the steam in a moment or two extracts inflammation and the splinter together. This is very efficacious when the offending substance has been in for several hours, long enough to have started up some of its evil consequences.

Does Your Head Aché?

Are your nerves weak? Can't you sleep well? Pain in your back? Lack energy? Apoplexy? Headache? Boil or pleurisy? These are some signs of poisoning.

From common poisons? From common poisons? These are always found in constipated bowels.

If the contents of the bowels are not removed from the body easily, or when they intended these poisonous substances are sure to be absorbed into the blood, always causing suffering and finally causing severe disease.

There is a common sense cure.
