A TREE'S FOOD.

Made by Tree Itself with Aid of Light-Practical Bearings of this Fact on the Work of the Forester.

Plants have to manufacture their own food; animals, on the other hand, depend on plants for their food; for, al- ing upon though a wolf may cat a sheep, yet the for the sheep fed on grass, and so the wolf indirectly depends on the grass for its This food is made by the plant from water, taken from the soil by the roots, and carbonic acid gas, or carbon dioxide, absorbed from the air by the leaves; these two substances are combined in the "leaves into a substance known to chemists as a sugar, though not much like the sugar we ordinarily

Every plant, from the tallest free down to the smallest of the algae, such as ing influent form the scum on standing water, has labor prof this power texcept a few plants, such as the fungi, which feed on other plants). La some cases-in very tall trees, for example—there are considerable difficulties to be overcome in raising the water to the feaves, in order that the food may be formed there.

Wilen the under surface of a leaf, i examined with a microscope; one finds there certain very small openings from the outside into the interior of the leaf, these are known as "stoniata." Through these openings; and thence into the interior of the leaf, air is continually passing, and this air contains a certain amount of carbonic acid gas tearbon. dioxide). In the interior of the leaf, inside leh cells of which it is composed: are a number of little bodies called "chloroplasts." . These take the water from the roots and the carbon dioxide. and dombine them to form this "sugar; and from the leaf the "sugar" is distributed again to the different parts of

But these chloroplasts work only while they cease work, resuming only when light returns. So the plant must have light in order to form its food. To the forester it is this last fact which

ic so important, namely, that the tree must have a good supply of light in order to make its food. If the needed Movement light is cut off from one part, the tree will do its best to reach out in some other direction and get the light in that

In any thick forest, whether large or small, trees naturally tend to crowd each nesday other. One of the forester's duties is to ment in regulate this crowding, and see that each the old pl tree, as far as possible, gets the amount, ing a new of light it needs. It is to this end that Nibissing. thinnings," which form so important a River part of intensive forest management,

Moreover the forester knows that by close planting he can eventually cut off the light from the lower parts of the trees, thus forcing the trees to grow upward in order to secure the light; and thus he will obtain tall, straight stems, while the lower branches, having, their light cut off, will die and finally fall off. The tree will grow out around the stub that is left, and, after that is accomplished, will begin to make the clear timber that is so much valued:

EATEN BY CATS.

Well-Known Resident of Found Dead on the Floor. despatch from Vancouver, B.C. says:

Herbert Lobley, a well-known resident of Central Park, was found dead on the floor of his house, on Wednesday, with and des his face and hands eaten off by cats. He ation. had not been seen for a week. His bro- Hion of ther went to the house and found his missionery in a letter tells of livers hav-dend body on the floor, with three cuts ing bent out of dead bodies and dead body on the floor, with three cuts ing ber in the same room.

Disastrous Fire in a San Francisco

A despatch from San Francisco says Twenty men were burned to death and twenty others in ured in a fire which destroyed an Italian hotel at Seventeent and Connecticut' Strons, in the Potrer district, early on Thursday. The injured were of the laboring class, and wene asleep in their rooms when the flip few cattle on the market showing enough started. Before they could be arouse quality for export, and there was little the flames had spread through the built demand for them. Quotations are uning. The walls fell and the impate Butcher cattle were selling well. There taken out dead and dying. People from were buried in the ruins, twenty being was no lack of differings, but the small other hotels in the vicinity rushed to the assistance of the buried victims ar sulted in butchers' stocks becoming succeeded in rescuing all of them from the flaming timbers. Teams were hu

ricdly harnessed and brought into service and the injura rushed to the Potrero Emergency Hospi tal, where several died while awaiting The fire that destroyed the Geneva

wifre it was discovered There w of 100 lodgers in the building, we rned like tinder, and most of these lost their lives were caught while pep and roasted to death. So rapidly the fire spread that it was impos e to do much in the way of resque, even when the fire apparatus a wed the blaze was so fierce that men were hardly able to place ladd a hinst the walls (They lid, however, nage to save a number of people of very top storey. In the work of W. A. Cole, a fireman, was thrown om a ladder, and it is believed fatelly The majority of the injured were hurt

leaping from the upper windows. A mber of women are reported to have en in the building, and all of them are dieved to have perished
