FOR WINTERING BEES

Some Insulating Materials and Their Appreciation.

Cork Dust and Dried Forest Leaves Are Better Insulators Than Wood Shavings or Sawdust-Even Temperature In the Hive Important. (Contributed by Ontario Department of Agriculture, Toronto.)

HE results of the relative non-conductivity of some beehive insulating materials are given below as the result of

tests, 100 being the standard: Very fine black regranulated cork (dust form), 100. Chopped straw, 86.

Coarse black regranulated cork, 85. Forest leaves (well dried), 84. Granulated cork, light or natural color. This is the grade usually used as packing about imported Malaga

rapes for instance, 84. 8-20 grade granulated cork (hatural color). It looks similar to preceding one but it is a little coarser in grain and lighter in weight, 80.

Sawdust, very dry and from well easoned and clean lumber, 68. Excelsior—grade used in packing

Planer shavings, 60.
The lesson of this table is that the fine black' cork dust is the poorest lator so far as the resistance of the passage of heat is concerned, and planer shavings is the best conductor of heat' and therefore the poorest insulator of the nine substances tested these results do not tell us anything Mr. Leonard Franceschini and his about the substances except their to conduct heat. It may be that if they were tried out as insulation for bee-hives we would arrange There are other properties besides conductivity of heat that figure in

at the beginning.

sarily is a poor conductor of heat, but all non-conductors are not neecssarily good insulators in practice, or, at any Mr. and Mrs. R. Millet, of Beaver- factory. Next to non-conductivity is Mrs. T. I. Fawcett on Sunday last. low mosture absorption or the ability to keep comparatively dry in moist weather conditions. Experts in beesince it causes dysentery among well. them. Let us assume that the air in a hive is very moist, say at a noring to inadequate protection or inhappens. The result is exactly the served on the outside of a water jug filled with cold water and set in warm air. Moisture congeals on the outside of the Jug, and it becomes cold and clammy and the water dring from it and makes everything else it touches ing was spent. Likewise the dew is formed. physical reason for these phenomena is the fact that cold air can-

> Some of the moisture held at high emperature must appear as drops of water at the lower temperature, or in other words there is a rain, and a rain in a bec-hive is a serious matter, but it can be prevented by controlling the temperature inside the hive. Herein exists one of the most important uses of the insulation about the hive. Other reasons why an insulation should not absorb moisture are that moisture increases the. conductivity of the insulation for respective homes here.
> heat and also makes it more liable Mr. Wm. Hampton's many friends to deterioration and decay, A good, will old maxim regarding success says, "Keep your powder dry." With equal emphasis it may be said: "Keep your Insulation dry if you would protect. Mi
> your bees well and give them a fair thance to succeed."
>
> Of the substances listed in the foregoing list granulated cork, forest was

> leaves (if dried for one year ahead). and planer shavings are the poorest and planer shavings are the poorest absorbers of moisture. Sawdust us weller, on Thursday. Weller, on Thursday. Weller, on Thursday. Weller, on Thursday. The very best, and decay best in rapidly, and chopped straw or overseer on the Provincial High-unless very well ripened and cured way here. John is a good man and may be objectionable in the same way as sawdust. Then, too, rats and mice are apt to bother it seriously. The Mr. Bob Telford is busy taking the Insulation must be odorless, else the bees may leave the hives. It must be readily available and reasonably cheap, and in these particulars for-est leaves, chopped straw and planer shavings are foremost. It also should be easy and agreeable to handle and pack in position, and not subject to spontaneous combustion.

Thirdly, the main reason for insulating the hives, especially in the winter season under outside conditions, is to conserve the bees own warmth so that they can live com-fortably and not have to eat an extraordinary amount of food in order to maintain a normal temperature. The bees get their warmth and energy burne, as I am now in the manufacturing business and am in a position to take care of any kind of Monumening wasted in cold weather in the surrounding atmosphere. A second reason is to maintain an even temperature in the hive, and this perfains both to summer and winter, or B. 496, Orangoville, Ont. Phone 190w to any season in fact. The insulation assists in preventing extremes of temperature in the hive as a large body of water does to the adjacent land areas. Another reason, and not the least because mentioned last, is that a good insulating around the hives provides a drier, and therefore a healthier and in all respects a bet-ter atmosphere for the bees than could be possible otherwise. Surely these are sufficiently good reasons why a hive should be protected by an efficient insulation. Flax chaff and a
