The pelvic arches Don't overlook the key days, whether you are growing potatoes or corn, or cucumbers. They are the days that unlock to you the extra yields and add overlation. It indicates only the im- functioning overy or a bird that is velopment, and that the hen in all mediate rate of production. A good not in a laying condition, Practically ried on during the month of August layer must have a large capacity, but all laying hens will show a good clearly indicate that at the end of the serve as a means of identifying ost or all hens with a large capacity are not spread in this region but all are not month the outlook was promising, stolen children.

Poultry raisers, as a class, are familiar with this bleaching process, commonly referred to as the pigmentation tost. It has a practical value in culling during the summer, and is essentially a test for the novice.

The yellow pigment which is evi-

dent in the shanks, and beaks of the Leghorns, Anaconas, Rocks, Reds, and Wyandottes, is re-absorbed and used for yolk coloring. After approximately eighty eggs have been produced, the egs will have bleached entirely, showing the pale or white condition common to hens that are recommended to be retained one year longer. The large every case show considerable yellow,

pigment in both the beak and shanks. We are no longer laboring under the delusion of the early moulting hen filling the egg basket during the winter months. Big records are impossible when production is limited to a few months in the year. It is the hen of Marathon type, rather than the sprinter, that covers the distance of two hundred eggs or better. | Egg | laying contests are not always de-

year, October 31. Ordinarily, the late-moulting hen presents a ragged, bleached appearance towards the end of October. This is due to the brittleness of the feathers which lose their oil and moisture content through intensive production. The hen on millinery display presents sleck, well-groomed condition, indiz cative of her past performance as a producer the social parasite poultrydom.

Late moulting and quick moulting are the policies of the heavy layers. Early and prolonged moulting is the policy of the slacker element.

The writer places special emphasis on the head in selecting for egg production. A definite correlation beween each section of an animal al- though he is not

vays exists in a well-balanced individual. The head indicates more accurately the delicacy and efficiency of the internal mechanism than any the internal mechanism than any other section in the production of gardener and farmer which was eggs.
