### Zoo Animals Have | Dogs Fed Soft Meat

By Craven Hill.

Generally speaking, most animals refuse to touch food which they do no "take to" by instinct, but there are some which will readily eat almost anything that is offered, whether it is

Some time ago a certain fallow deer ecame known for its odd habit of cating paper, with the result that people plied the unfortunate animal with this very unsuitable form of nourishment until it died. A post-morten examination showed that its stomach contain ed sixteen pounds of newspaper and paper bags! You may say that the animal should have known better, but In midsummer, during the hot Zoo's season is at its height. The gardens are crowded on every fine day by visitors who have come to see the baby animals and young birds, and perhaps to feed them. It is certainly the best time to pay a visit to the gardens, for in June and July every Zoo

mother is busy rearing her young. Zoo's Biggest "Guzzlers"

Summer also being the time when the "Eat more fruit" enthusiasts are at large, it follows that much of the food given to the animals is of this kind. But too much fruit-or unsuit able fruit-is a frequent cause of in ilgestion among Zoo animals.

It is really astonishing what some animals will eat if given the opporunity. The fact that their digestive p wers may be slight does not weigh either with themselves or with the public who feed them.

Probably the biggest "guzzlers" at the Zoo are those with feathers on Baby birds are notoriously them. greedy, but the young bird of paradise excels them all, for he will cheerfully

#### eat until he falls into a fit!

Ravens have a strong partiality fo grapes and will gorge on them; ill to find out the facts responsible for they can eat no more. Any further offerlings after saturation point has been reached are stored away in odd cor aers against the time when appetite shall return.

The snakes being kept behind glass panels, cannot be fed by visitors, and this is perhaps just as well, for snakes do not always know what is good for them. One python actually swallowed a blanket which had been placed i its cage. Another snake of the same species tried to swallow a bamboo pole

which was being used to push forwar patterns as you want. Enclose 20c in the got about two feet of the pol stamps dr coin (coin preferred; wrap down its throat before it discovered its it carefully) for each number, and error and began to jib. After much

address your order to Wilson pattern painful struggling the unnatural die was happily disgorged. The monkey tribe, generally spea ing, has a tough digestion, which is as well, since more visitors flock to the monke house than to any other. What If a boy, jumped into the river after is more, some monkeys discriminate salmon and found it wasn't there quite wisely in what they eat: One o

## Tough Indigestions Live to Ripe Old Age

Do Not Feed Your Dog Choice Cuts-Prefers Cheaper

To make dogs live to a rine old age and stay healthy, do not feed them the choice cuts of meat, but give them the soft internal organs, the parts usually thrown away. That this is the proper way to feed our canine pets is vouched for by Dr. William Lentz, director of the small animal hospital of the University of Pennsylvania. In a long research on the longevity of dogs Dr. Lentz has found that in dogs reaching a life span of twenty years or more the great majority had access to the what about the visitors who fed it? waste meat materials, the scraps, the onths of June and July, special care used glands thrown away by butchers. soft inner parts and the various un has to be exercised in feeding the Dogs so fed lived from thre to four 'times as long as dogs fed a carefu meat diet of the better portions of the firm muscular meat such as are eaten by humans.

The dog, left to himself, is ordinar ly carnivorous and follows the instinct of his wild cousins in eating the inner organs rather than the muscular flesh. It appears that these animals derive some benefits from the softer diet and from certain chemical properties of the glandular organs.

One of the main reasons for the rewe do them an injury, while thinking to benefit them, by feeding them what ve ourselves would like to be fed. As a contemporary check on this viewpoint in regard to dog dietetics, it is interesting to know that Dr. Herbert Fox, director of the pathological

aboratory of the Philadelphia Zoological Society, has found that a diet of muscular meat fed to lions and other carnivora in captivity is not nearly so beneficial to them as a diet of softer meat which more nearly re sembles their choice in the wild state. Dr. Fox, who is also director of the Pepper Pathological Institu author of works on the diseases of wild animals, is studying this subject
