MINERALS IN HOG FEEDING

If properly fed a young pig will increase its weight one hundred times in six months, or from about two pounds At Monday evening's meeting of the at birth to about two hundred pounds at six months old. To produce this very rapid growth all the necessary elements. including minerals, must be provided. If minerals are lacking in the ration, the pigs become unthrifty in condition, and growth is much slower. Spring pigs secure the necessary minerals largely from pastures and from eating the freshly rooted soil. Minerals from these sources are not available for fall litters. which are fed mainly in dry lots and pens, and an adequate mineral ration

should be provided. A simple mineral mixture which has been used successfully for a number of years at the Dominion Experimental Station, Lacombe, Alta., consists of 76 pounds of slack coal, 20 pounds of salt, pounds of air-slacked lime or ground limestone and one pound of sulphur. The mixture is fed in boxes, or in separ ate .compartments of the self-feeder to which the pigs have free access.

TAKING SIDES.

There are times when it is better no to take sides. Often a group of friends or even a community is divided by a quarrel which is no concern of the outsider. One and another take sides, however, until the whole body is divided into two...opposing factions. Taking sides in a personal quarrel is generally uncalledfor and disastrous.

In matters of principle, however, there is a difference. Take the question of prohibition for instance. You' cannot stand back and leave those who believe in prohibition and those who are against it, to fight it out. Take the question of cigarette smoking by young people of fence because he does not have sufficient intelligence to weigh the evidence and because he is afraid to join either party.
