How Filters Produce Better Photographs

ters - those little places of color- lessened in intensity. ed glass or golatin which can do so much in improving pictures. Unfortunately many amateurs shy nway from filters because they rugard them as mysterious, compilented devices, almost in the same

class as a witch doctor's tools, The object of a filter is to prevent light of certain colors from reaching the film. When a beam of light, either natural or artificial, passes through a prism (lons), it is spl.t into its component parts -a

Control End Result

In other words, filters are simply another tool to control the one regult of picture taking, the same as shutter speeds or lens openings The same object may appear differently to the human eye and the photographic film. Filters compensale for this and allow you take a picture exactly as it appears to you, or differently, depending on

There are three common types of filters that are useful to the average amateur for black-and white photography. They are cortothen or "orthochromatic" filters that record brightness exactly as the appears to the eye, contrast filters that create a difference in bright ness between two objects that have

> details. By using a correction filter you can achieve the desired results. Answer Questions
