SOLID BITS OF AIR

FROZEN IN INTENSE COLD AND LOOKING LIKE ICE OF GLASS

Prof. Dewar's recent work for the Absolute Zero... The conditions of matter at the absolute zero can only be forecasted by the conditions of matter at the lowest point of the absolute zero...

The whole idea is pressure. Compression forces certain gases to become liquids, and when the pressure is removed and they are permitted to return to the gaseous state, they absorb from their immediate surroundings as much heat as was originally put in to liquefy them.

Nitrogen oxide gas is liquefied by a pressure of 1,400 pounds to the square inch. With it liquefied, it creates a cold of 190 below zero. With it liquefied, it creates a cold of 1,800 pounds to the square inch, and the cold from the evaporation of the liquefied gas is 210 below zero.

This method is preliminary, and may not be new. However, it is a method of liquefying gases which is practically unobtainable, however, in view of the results of Prof. Dewar's experiments upon the action of matter as it grows colder. The increase of volume of a gas which has been made evident shows that the colder a planet grows the more tenaciously its particles must be held together, and the harder and more enduring it must become.

A powerful electric light is now set in motion inside the vessel, and the tremendous heat and light which it is giving off, after passing through the lens, is directed straight into the parallel lines, and these are then sent through the oxygen. Their heat at the point of passage is great, far above the boiling point of water, say 300 degrees.

These elusive and magical properties of heat cause some scientists to lose weight over denigrating concerning it, and make them loath to admit the probability of the absolute zero. This point, however, which is 461.9 degrees below zero, is a point which is clearly indicated as a finality by the action of gases and metals subjected to lower and lower temperatures, that it is certainly a point in nature of very great importance.

Prof. Dewar, who has carried working temperatures down to the lowest point known to anybody before him, is still 110 degrees distant from the great and ultimate end of his pilgrimage. He has gone as far as he can with the apparatus which has been able to create, and knows it. To do this is to know it.

NOT A HALF-WAY GUY

He was in love with the girl and wanted to marry her, but he was cautious and didn't believe in the policy of putting all his eggs in one basket.

"Well," she said, "measuring the distance between them with her eyes, it was no longer a matter of feet, but of miles."

He was in love with the girl and wanted to marry her, but he was cautious and didn't believe in the policy of putting all his eggs in one basket.

He was in love with the girl and wanted to marry her, but he was cautious and didn't believe in the policy of putting all his eggs in one basket.
