Canada's Most Important Building is rodded with

Shinn-Flat Lightning Rods

After careful investigation Shinn-Flat Lightning Rods were selected by the architects as the Best and Most Efficient for protecting the New Parliament Buildings, Ottawa. It required 25 groundings, 76 points and nearly 5,000 feet of cable, an immense building whose architectural beauty was enhanced by the artistic effect of Shinn-Flat Cable and Fixtures.

WATER IN FARM HOMES

Compression System Will Give General Satisfaction.

Water Pumped Into a Metal Tank Against Compressed Air—Various Methods of Working the Pump—Air Valves a Necessity—Seven Steps to Success in Poultry Culture.

(Contributed by Ontario Department of Agriculture, Toronto)

In my last article I described briefly the attic tank system of water supply for the rural home. This system has given very good satisfaction in the past, but I doubt if it will be installed in many homes in the future, as there is now on the market something very much superior in many respects. I refer to the compressed air water system, which I will try to describe in a few words.

How the System Operates.
The chief feature of this system is that water is pumped into a strong air-tight cylindrical metal tank against the entrapped air which is compressed in the upper portion of the tank, and the compressed air constitutes the power to drive the water out of the tank when a faucet is opened on the discharge line. This is very simple. The metal tank will vary in size according to the amount of water used, but a common size is 6 feet by 2 1/2 feet. It should be kept about full of water and at a pressure varying from 40 to 45 lbs. Greater pressure, if required, may be secured by pumping the water to a higher level than named in the tank, or by pumping some air into the tank before any water is pumped in. A water gauge is attached to one side of the tank to indicate the height of the water in the tank, and on the discharge pipe close to the tank is a pressure gauge. The tank must be kept in a frost-proof place—say the cellar, or an underground pit. The water keeps cool, clean and fresh in this tight tank.

Methods of Working the Pump.
There are many different ways of operating the pump in order to fill the tank. By hand, by windmill, by gasoline engine, or by electric motor. A few minutes of pumping each day by hand will keep an ordinary-sized house supplied with plenty of water. When the pump can be operated by windmill or electric motor, there is the great advantage of automatic starting and stopping of the pump. The automatic electric water systems of the present day are very convenient and also very efficient. In case of shallow wells and cisterns the pump and motor can be located inside the house or barn. As farmers get electric current these automatic systems will become very common both for shallow and deep wells. The automatic systems require very little attention and are very noiseless. There are several styles or designs, but any of them of reputable make will give good satisfaction if the installation has been done properly and if the outfit is given good care. If soft water as well as hard water is required under pressure, two tanks are necessary, one for soft and one for hard. Only one pump is required in this double tank outfit.

Pumps used in connection with compressed air systems must be provided with an air valve for renewing the air in the tank because the air dissolves in the water and escapes with it. If means for pumping in air were not provided for, the tank would eventually become water-logged and the system would be rendered absolutely useless.

The compressed water system is described and illustrated in Bulletin 267, entitled "Farm Water Supply and Sewage Disposal." A copy may be secured without cost by dropping a line to the Department of Physics, O. A., Guelph, Ont. Give us a chance to help you solve your water supply problem.—R. R. Graham, O. A. College, Guelph.

Seven Steps to Success in Poultry Culture.

1. Keep accurate records. Little progress can be made without this first step.
2. Feed a properly balanced ration. Such a ration furnishes nutrients for growth, maintenance, fattening and eggs. The production of eggs must be a constant aim.
3. Give proper care and comfort by good housing and management. Discomforts are: Extremes of heat and cold, hunger and thirst, four air and dampness, and diseases and parasites.
4. Keep standard-bred, utility stock. There are five good breeds for the farm: Plymouth Rock, Rhode Island Red, Leghorn, Wyandotte and Orpington. Varieties of these have been bred for heavy egg-production.
5. Breed from the best, both male and female.
6. Sell unprofitable stock.
7. Market graded products. Maximum returns are secured from graded products. Markets demand a constant supply, and this calls for community co-operation.

Age of Cows.
It is more difficult to determine the age of a cow than of a horse, say the live stock men at the State College at Ithaca, New York. They agree that some estimate of a cow's age may be made from her teeth and horns. The number of "annual rings" on the horns, plus two, for example, usually gives the animal's age, but remembering that the pairs of permanent teeth come nine months apart and the first pair comes at about 19 to 24 months of age, will help to verify it.

Inspect potato fields for diseases and impurities and remove all plants necessary.

A Safe Rule to Follow in Buying a Used Car

A fundamental rule of good business is to know what you are buying and from whom you are buying. This rule holds particularly true when it comes to buying a used car.

If there is one place more than another where you must place above everything else, the integrity and financial standing of the dealer and his unquestioned honor in living up to every promise made in selling you the car, it is on a used-car proposition.

A McLaughlin-Buick dealer values good will above everything else. He would never have been selected for a McLaughlin-Buick dealer in the first place if he didn't.

Therefore when you buy a used car from us, you follow the fundamental business rule of knowing what you are buying and from whom you buy—You play safe.

Special Notice SHOE REPAIRS

The only fair way to do any kind of a job is by piece work (price) so in the future I will charge so much for the material used and a reasonable price for the time it takes to do the work, this will cause my prices to vary, but in shoe repairing charging a customer who wears a 6 1/2 shoe the same price as the one who wears a 10 or 11, is not really the proper thing to do, as the party with small feet is helping to pay for the one with the larger. I range my prices according to the size of the sole or heel used not the size of shoes. I soles and heeling will range from 75c to \$2.00. Whole soles, new heels, repairing welts, sewing, toe caps, etc. will cost extra. I don't repair while you wait, as this is not a proper paying system. I have the experience, tools, machinery also the largest trade for repairing in this section of the county. All repairs receive the very best and prompt attention. Shoes called for and delivered.

You get all the cream with a De Laval

Not every separator is designed so that it will get all the cream. But there is one machine that can always be depended upon to skim clean—the De Laval.

A De Laval user gets more cream from the milk of each cow, gets longer service from his machine, and spends less time turning and washing it. Ask any of them.

De Laval butter has won at every meeting of the National Butter-makers Association, with one exception.

Wouldn't you like to know more about the De Laval? Stop in.
