

THEY WERE SEVEN

Seven little babies,
Tiny yellow chicks,
Old Cat grabbed one
Then there were six.
Six little fluffy balls,
See how they thrive,
Mother Hen stepped on one—
Then there were five.
Five darling chickens,
Scratching near the door,
Mischievous little ones,
Then there were four.
Four lively youngsters,
Plinking by the tree,
One ate a poison bug—
Then there were three.
Three scrawny fledglings,
Gobbling oyster stew,
One overate himself—
Then there were two.
Two dusky cockerels,
Scrapping in the sun,
Automobile passed along—
Leaving but one.
One lonely rooster,
Pecking at a bug,
Company for dinner—
Now there are none.

Take Notice

People who have sheeting, rafters and good frames, fast going out for want of protection with galvanized corrugated sheets. At present prices are less considering their movement on market for this line, no use to sell and buy, the other place is worse. Take stock and have a talk with Gilbert Simcoe, 1033 R.R. No. 1 Georgetown, Steel Truss Barns. Garages all kinds of galvanized tanks. Lightning protection. 4-23-1f

Mortgage Sale

Of Valuable Farm in Chinguacousy Township

Under powers contained in a certain mortgage made by John J. Kelly to the Vendor which will be produced at the Sale there will be offered for sale by public auction on the premises on Wednesday the second day of July 1924 at two p.m. by R. J. Kerr, Auctioneer, all that valuable farm property composed of the West half of lot 25 in the sixth concession, west of Hurontario St., in the Township of Chinguacousy, containing one hundred acres more or less and formerly known as the John Miller Rutledge homestead. There is said to be on this property a two story frame residence containing six rooms with wood cellar and woodshed also a barn 46x55, a shed 24x51, a shed 24x30, a shed 20x30, a pig pen, 16x16 and a driving house 10x20. There is an orchard of one and a half acres, a good well and two cisterns. The soil is clay loam and over 90 acres is under cultivation. The property is five miles from Georgetown and one mile from the Terra Cotta Railway Station. The property will be first offered and if not sold it will be offered in two separate parcels of 50 acres each, parties desiring to purchase at the time of sale shall be announced at the time of sale. Terms—10 Per cent of the purchase money to be paid to the Vendor's Solicitor at the time of sale, sufficient to reduce the balance owing to \$5,000.00 within 30 days thereafter, and the said balance of \$5,000.00 may be arranged for on easy terms or paid in cash at the purchaser's option. Possession will be given the purchaser at the expiration of the above 30 days. Further conditions and particulars of sale may be obtained from: H. N. FARMER, Vendor's Solicitor, Action, Ontario.

WHAT PURESEED MEANS

To the Agricultural College and the Farmer

Seed Selection Helps in Kym One Year—Large Plump Seed Best—Soil Fertility Experiments Give Interesting Results—Feeding "Alves." (Contributed by Ontario Department of Agriculture, Toronto.)

During the year 1923 the Field Husbandry Department of the Ontario Agricultural College supplied to nearly 2,000 farmers pure seed and other material, with instructions and full information for conducting tests on their own farms.

One hundred and twenty-one distinct experiments were conducted during the season on the Field Husbandry area.

Selection of Seed Important. Different selections of seed of various classes of grain have been carefully tested at the Ontario Agricultural College for from six to nine years.

The average results show that even "one year" selection of seed grain has a marked influence on the resulting crop. In every instance, the large plump seed gave a greater yield of grain per acre than medium sized, small plump, shrunken or broken seed. In the average of the six classes of grain the large plump surpassed the small plump in yield of grain per acre by 10 per cent, and in the average of the three classes of grain the plump seed gave a yield over the shrunken seed of 20 per cent.

SOIL FERTILITY EXPERIMENTS.

Following Up the Soil Survey—Lime Phosphate With Wheat—Experiments With Potatoes.

The three demonstration plots that have been started as a follow up work in connection with the soil survey are now giving interesting results. The outstanding feature so far is the proved beneficial effect of lime and phosphoric acid. On the light sandy soil of the Norfolk County plot the increasing amount of decaying organic matter is beginning to make itself felt in the improved texture of the soil and increased crop yields. On all three of these experimental plots certain mixtures of fertilizers are giving striking results, while other mixtures are not.

Lime Phosphate Experiments With Wheat.

The lime phosphate experiments planned to discover the effect of lime, lime and acid phosphate and mixed fertilizer on wheat and the succeeding crop of clover, have given very interesting results. Each experiment consisted of four half-acre plots, and these were later divided into three different farms in eight different counties, twenty-four experiments in all. As these experiments were started in the fall of 1922, only the wheat crop has been harvested. The clover, however, shows marked difference in development in the various plots and interesting results may be expected next season. The outstanding results so far obtained is that acid phosphate increased the yield of wheat in every experiment. The average for the check plot was 22.2 bushels per acre, and the acid phosphate plot, 24.4 bushels per acre, an increase of a little over 10 per cent. Assuming that the addition of the acid phosphate at the rate applied on these experiments would have given the same results on the 112,000 acres of fall wheat harvested in Ontario in 1922, the value of the crop would have been increased by nearly eight million dollars, at the present value of wheat harvested in Ontario in 1922, the value of the acid phosphate of over four million dollars.

Experiments With Potatoes.

The Triangle experiments with potatoes have demonstrated in every county where held that legumes may be used to gather all or nearly all the nitrogen required by the potato crop, and that phosphoric acid and potash in proper proportion may be used to increase both the quantity and quality of the crop with profit.

This work is being extended to eight additional counties and is being carried on by the Chemistry Department of the Ontario Agricultural College in co-operation with the Agricultural Representatives—Dept. of Extension, O. A. College, Guelph.

Feeding Calves.

It is considered a good practice, in teaching calves to eat grain, to begin by feeding them a little ground corn or sifted ground oats. This kind of feed may be given for a few days, and then they may be given either whole oats or whole corn, or a mixture of equal parts by weight of both. This whole grain may be fed to the calves until they are to eight months of age and then they should be fed ground feed. When a calf reaches eight months of age it does not chew its grain so well; consequently a high percentage of the grain will be lost if fed whole. The theory of feeding ground feed to calves is to train them to eight months of age is that they chew the grain better, which stimulates the flow of saliva.

If now wheat, which is frequently damp, is thoroughly mixed with dry old wheat from the previous year and put into bulk storage for a few days, experiments show the dry wheat absorbs a sufficient amount of moisture from the damp wheat to improve both kinds for milling purposes.

Keeping the animals inactive with good feed is not a kind of hard work all the time, with good care, is much more so.

TORONTO Running Water!

When and Where You Want It.

On any farm of average size at least one hour a day—365 ten hour working days a year—are spent in the irksome, wearying task of pumping water. 365 days which one of my Toronto Windmills will give you for profitable work, rest or recreation—besides supplying running water wherever you want it.

The one bothersome task, that of oiling the windmill in all kinds of weather, is overcome in the Toronto Self-Oiler, which requires fresh oil only "once a year." Friction and wear are practically abolished. Toronto windmills, too, can be made absolutely self-regulating in operation.

The "Toronto" Tower will stand for a lifetime because it is the heaviest, strongest and best-braced one built for any windmill. Let me explain why I believe this is one of the biggest conveniences you can have.

Let us help you plan your vacation so that there will be no incongruities to put up with either at your summer cottage or for "babby" hatching it at home. Ask your Store Manager about our summer grocery plan.

WE SELL TO SATISFY

SHEEP IMPROVEMENT

Present Trend of Progress in Sheep Breeding

Fewer Breeds and Better Breeding—The Down Breeds Becoming More Popular—Relative Standing for Prolificacy.

The world ever clamors for something new. It matters not in what sphere our lot is cast, the call for the production of new materials is always upon us and the man who does not progress loses the race. Perhaps many people still believe that there is room for new breeds of live stock and that Canadian breeders and investigators should be bending every effort to produce them. Perhaps new breeds could be produced to meet certain special conditions better than they are now met but the writer believes that general progress for the good of the live stock industry would surely follow a policy of fewer breeds with better breeding. For concentrated effort, for uniformity in output, for competition in world markets, the most profitable to the farmer and greatest satisfaction to the consumer we already have many breeds in some classes of stock. True, there is room for all the breeds, but because we have wide acreage and the production of good conditions is no reason why these acres should be grazed over by, and be growing food for, anything but the most suitable breeds from the viewpoint of both producer and market man. The day of keeping a breed because it has been bred is fast being gone forever, and the breed, whatever it is, should win its place only through its ability to produce a profit to the breeder, the highest grade product in demand by the consumer. In short, markets are exerting a greater influence than ever before in breeding work and there is no doubt that such influence must increase.

Fewer Breeds and Better Breeding. Keeping this in mind the progress being made in animal breeding is not so much toward the production of more breeds but rather toward early maturity and improved type in the breeds already in existence. If we had fewer breeds we could make more rapid progress. Indications are that certain breeds must gain the ascendancy and these will be those which are bred to supply what the consumers want and at the same time the fewest highest returns for his effort. Now breeds may come, as did the Corriedale sheep in New Zealand, to fill a special want, but better individual and stronger strains in the best breeds have the goal of the present day breeder in Canada. New Zealand wanted a sheep that docked easily. They wanted a bigger sheep than the Merino with a better grade of wool than the Lincoln, so they made a dual-purpose breed by crossing Lincoln rams on Lincoln ewes and practicing careful selection. The production of Persian lamb in Canada is another case where certain methods are followed to produce a dual purpose. The writer has heard that a certain well-known professor in one of the leading universities in Canada is at present busy in the making of a tall-tailed breed of sheep to get around the trouble of docking, and by selection, it is said, progress is being made.

The Down Breeds Becoming More Popular. So far as sheep are concerned breeding work is pretty largely confined to selection in our recognized breeds with the idea of meeting the market. Now, that market demand for the finer and medium grades of wool and the eighty-four pound lamb, and it would appear that so far as markets for mutton sheep are concerned the Down breeds may get the inside track. Fifty-six per cent of 62 lamb carcasses and racks, thirty-six per cent in front, and 7 per cent in flank. We are after the highest possible percentage of leg and back, which sell for just as much as much per pound as front quarter and eight times as much as flank. Progress is only made by keeping weight and type in mind.

So far as Breeds in Concerned the relative standing of the breeds of mutton sheep in Canada is as follows: Dorset, 14.6% increase; Leicester, 15.4%; Hampshire, 14.9%; Suffolk, 14.8.5%; Lincoln, 14.8.5%; Shropshire, 14.3.6%; Southdown, 14.2.2%; Cheviot, 13.9.2%; Cotswold, 13.8.0%; Romney Marsh, 11.3.9%.

2. The average increase for all breeds of mutton sheep in Canada is 14.6.5%.

3. The average increase for all long wool breeds of mutton sheep in Canada is 13.6.2%.

4. The average increase for all Medium Wool breeds of mutton sheep in Canada is 13.6.2%.

O. A. College, Guelph, Ont.

We are made for co-operation, like feet, like hands, like eyes, like the rows of the upper and lower teeth. To act against one another, then, is contrary to nature. It is acting against one another to be vexed and to turn away.

The boys are certainly helping to bring about a better standard of living. A sow, a cow and some hens with a club boy on the job will get the desired result.

I believe in going to the bottom of things and therefore in deep plowing and enough of it—Henry Ward Beecher.

Club work develops the manhood and womanhood of the coming generation.
