Remember that a good soaking once a week is more beneficial than light sprinkling daily. Be judicious in your use of the hose. Leafy vegetables do not mind having their tops soaked, as well as the roots. But fruit bearing plants and vines, like tomatoes, eggplant, cucumbers, peppers and melons should not have the tops soaked at all. It washes-away the pollen in the blossoms and is

apt to cause blight and fungous

-R. R. Grabam, O. A. College,

Don't water the garden in the heat of the day. Wait until late in the afternoon and when it has been given a good scaking it will have time to soak into the soil to enable you to rake up the surface easily next morning, preventing the soil baking and conserving the moisture. Regular soakings for the ever-bearing strawberries and other small fruits, followed by mulching, will prolong the rult bearing season and improve the quality. Too much watering of grapevines tends to cause an excess of cane growth but a reasonable amount

le destrable. There might be an excuse for using an interior sow if you already have her on the place, but we can not think of one single excuse for ever using an interior sire. For the adventurous visitor Lake Minnewanka offers ice-yachting. Dog-sled races are a never failing source of interest. These races are often run down the main street, and, as in other sports, it is often a case of the best comes to life with the coming of snow. One event and community effort follows the other, and a long list of often happens that an over anxious or jealous contestant sporting activities culminates in February with a huge grabs an opponent in any convenient place and in the seven day carnival in which all citizens and hundreds ensuing mixup any old hound can waddle home an easy winner. But its all in the game; and the game at Banff is It will only be the case of a very few years until the out-door game-with dancing, cards or concerts in

What is known as "Thumps" In Young Pigs

suses of the Trouble-Preventle and Treatment-Pointers in S lecting a Brood Sow-Age of Broo Sows-Don'ts for Dalrymen.

(Contributed by Ontario Department of Agriculture, Toronto.)

The term "thumps" is applied t a nervous disorder of young pige which is characterized by violent jerking movements of the body. The jerking movements of the body are caused by spasms affecting the diaphragm or midriff which is the muscular partition separating the chest and abdomen, and is an important organ of respiration. This spasmodie contraction of the diaphragm is similar to hiccups in people. Cause of the Trouble.

The cause of the trouble appears to be due to some disturbance of the nerves which supply the diaphragm. in many cases the nervous disturbance is the result of some derangement of the digestive system. Lack of sufficient exercise and overloading of the stomach are common causes of thumps in young pigs. At times there appears to be an inherited tendency to this trouble in the case of litters from pumpered or overfed sows When pigs, become, affected with thumps the trouble is plainly shown by the thumping, jerking movements of the flanks. The jerkings are sometimes so marked that they move and sway the body back and forth. The attacks are usually more aggravated after feeding when the stomach is full. The trouble may last only for a few days in some cases, and in others it may last for several weeks and some fall to recover.

Prevention and Treatment. This trouble of young pigs can be largely prevented by allowing them exercise and avoiding overfeeding. When they become affected they should be made to take exercise in a good, large, roomy place. In summer they may be turned out to pasture and allowed to range about. Badly affected pigs should be given dose of castor oll to clean out the stomach and bowels. To lessen the spasms of the diaphragm from five to ten drops of laudanum can be glyen,gyery four or five hours. The affected pigs should be kept on a light diet for a few days and kept hungry so as to encourage them to roam about more and get plenty of exercise.-Dept. of Extension, O. A. College, Guelph.

The Selection of a Brood Sow. The importance of the careful | selection of a brood sow cannot be 🛊 over-emphasized. So says Professor 14 Wade Toule of the O. A. C. It is true that the sow's influence is reflected | on her own litters only, whereas that of the boar is reflected on 2 all litters which he sires, and while many characteristics are common to both sexes of breeding stock, 2 there are others which are very essen-Bal to the respective sexes and opposite in nature.

Information as to the history of and Threshing purposes. the ancestry of a young sow is of considerable value. Experience and observation go to prove that certain strains or familles of hogs of different breeds rather than simply breeds themselves. There are good and bad in all our breeds, consequently the prospective purchaser should ascertain as much information as he can concerning the type, the quality and the prolificacy of her aucestry, whother or not they have been thrifty and economic feeders, and whether or not the sows have been good mothrs. Canadian hog raisers can well take an object lesson from the results which the Danish breeders are experiencing where all the above information is available to the prospective purchaser. Moreover, every breeding hog must measure up to a certain standard before that hog is eligible for sale .- Dept. of Extension, O. A. College, Guelph.

Age of Brood Sows.

Unusually a sow is most prolific when she is from two to four years when about two and a half years. Soon after she reaches maturity she is at her prime. After the sow bas reached four or five years her powers hegin to wane, and it is not long after that when she becomes upprofitable. Just how long to keep a sow will depend upon the individual. If properly"handled two litters of pigs a year can be secured from a sow. It is not best to breed a gilt until she is eight to ten months old. Pigs can be weathed at six weeks of age. bue eight weeks in probably better. They should be eating long before they are weaned and be well able to secure all the nourishment they need from other sources than the sow's milk, so they will not be checked in their growth by weaping. Many sows will accept service within a few days after farrowing, but it is not best to breed them until after the pigs are weaped, or in eight or nine weeks. The welfare of the sow and the next litter of-pigs should be kept in mind. and the sow should have time to recuperate after raising a bunch of lusty pigs before undertaking the job | -----
