kinds

Office Town Hall

From time to time we have reports  
of persons, born or died in a given  
period and comparison is made with  
other similar periods of time for the  
purpose of showing whether there has  
been improvement or otherwise. It is  
fairly evident, however, that the public  
has a right to know the value of statistics  
of no practical value. Figures as  
such are of no definite service unless  
practical use is made of them.

For instance, to state that there have  
been no accidents on saws or on  
priming press or on drop hammers  
may provide an interesting topic of  
conversation or may, if properly used,  
point out the necessary corrective  
measures. A close analysis of any  
given subject such as accidents will  
reveal information of extreme value.

In general the principles of hay  
making are the same for all hay crops.  
The crop must be cut at a stage of  
maturity that will give the highest  
yield of palatable hay. Above all, the  
crop must not be permitted to ripen  
too far or the resultant feed will be  
woolly with a high percentage of  
wastage when fed.

In the making of clover hay the  
best quality is obtained where the crop  
is cut when in full bloom, or when  
the heads are just beginning to turn  
brown. It should be cut in the morning  
before the dew has fallen. It may be  
tedded or turned by hand, and then  
colled in rather small but carefully  
made coils. In the evening, if of this  
type, curing best under conditions which  
prevent very rapid drying of the leaves.  
If favorable weather obtains the hay may  
be taken in after several days directly  
from the col, although if help is  
available very fine hay results if the  
coils are shaken out several hours  
previous to hauling.

When a heavy rain has fallen on  
clover after it has been cut, the operation  
of curing becomes difficult. If  
very wet, it will be in heavy coils and  
will mildew; if spread out in the hot  
sun, the leaves blacken and break off  
readily, leaving a hard, unpalatable  
practical way in Ontario. Speaking at  
the Industrial Accident Prevention  
Conference in Washington a fortnight  
ago, R. B. Morley, General Manager  
of the Industrial Accident Prevention  
Association (Ontario), told how the  
Associations operating under the authority  
of the Workmen's Compensation Act are  
investigating the causes of industrial  
accidents reported by industry to the  
Compensation Board and, based on  
these investigations, are making  
recommendations for the improvement  
of conditions. Such use of statistics is  
of real value to industry in this country.

Under very favorable weather conditions,  
timothy and mixed hays should be cut  
in the morning and stored away in the  
afternoon. There are arguments for and  
against such a practice. With hay cut at  
the proper stage of maturity to ensure the  
greatest palatability, it is responsible  
to store it properly in storage under  
such treatment. At a later stage, let  
the hay be cut in the afternoon, and  
store it in the morning. It is quite possible  
to follow such a practice successfully. - B. E. Tinsley,  
Dominion Experimental Station,  
Charlottetown, P.E.I.

Upwards of 900 barns were destroyed  
last year in Ontario by fire. This is a  
most appalling loss and if the destruction  
of such a large number of barns is not  
checked it will mean increased insurance  
rates, which are quite high enough now.  
It is responsible to store hay properly  
for a good many losses on the farm; then,  
too, there is the fall threatening  
the danger of the engine; then, too, there  
is the lantern, which has destroyed many  
a good Ontario barn, and last of all, and  
most of all, the danger of the fire in the  
barn. If a fire starts the loss is generally  
total, for a fire where there is hay or straw  
cannot be put out easily. The farmer who  
wishes to save his barn should be well  
advised to discuss the increased insurance  
rates and their cause.

Word was received here recently of  
the death of Dr. David Trimble, of  
Medicine Hat, Alta., who was taken  
sick two months ago with influenza  
and heart trouble, and was getting  
along nicely until two weeks ago,  
when other complications set in. He  
passed away came as a great shock  
to his family and friends. He was a  
son of the late John A. and Jane  
Trimble, third line west of Chignascoy.  
He is survived by his wife, formerly  
Miss Maud Mitchell of Orangeville,  
and two daughters, Mrs. M. Keating,  
of Medicine Hat, and Mrs. Will Brown,  
of Vancouver, B.C., and one son, Norman,  
at home. Mr. Trimble's brother, Edwin  
and Henry Trimble, West Chignascoy.

Haltom is to have a School of Agriculture  
to be opened in HALTON

Be Charitable.  
More charity for others will mean  
charity for ourselves and we will  
gradually come to take a keener  
delight in helping something good  
of some person than something bad.  
Good is constructive, bad is destructive.  
Just before you go to bed, think  
out a bit of "be news," stop and  
take a moment. See if you can't  
think of something good to say in  
place of it. The chances are that you  
will find one that you can say and that you will

### LOVE'S CALL

Fair as is the noonday splendor,  
Gentle as the evening dew,  
Comes in tones most sweet and tender  
That great message ever new.  
Which to human hearts is saying:  
"Precious treasure you may find  
If you will, love law obeying  
Lie at peace with all mankind."

Leave the angry word unspoken  
Silently to be dissolved;  
It may prove to be a token  
Of what is in love involved.  
That which causes grief and sadness  
May be other than it seems,  
It may harvest yield of gladness  
For beyond your brightest dreams.

With the gracious and forgiving  
Always lovingly owned moves  
Crown the life which you are living  
With the precious crown of love.  
So the seed which you are sowing  
Where each day presents a field,  
Into strength and beauty growing  
Will a bounteous harvest yield.

WATSON,  
Ridgeway, Ont., 1926.

### SAFETY STATISTICS

### CURING HAY

(Experimental Farms Note)  
Hay, to be of the best quality, must  
be cut when the crop is at the right  
stage of maturity, and must then be  
cured in the best manner. Over-curing  
may cause a large percentage of leaf  
and is of inferior feed value.

In general the principles of hay  
making are the same for all hay crops.  
The crop must be cut at a stage of  
maturity that will give the highest  
yield of palatable hay. Above all, the  
crop must not be permitted to ripen  
too far or the resultant feed will be  
woolly with a high percentage of  
wastage when fed.

In the making of clover hay the  
best quality is obtained where the crop  
is cut when in full bloom, or when  
the heads are just beginning to turn  
brown. It should be cut in the morning  
before the dew has fallen. It may be  
tedded or turned by hand, and then  
colled in rather small but carefully  
made coils. In the evening, if of this  
type, curing best under conditions which  
prevent very rapid drying of the leaves.  
If favorable weather obtains the hay may  
be taken in after several days directly  
from the col, although if help is  
available very fine hay results if the  
coils are shaken out several hours  
previous to hauling.
