CENTRE-POISE RIDING in V-8

PASSENGERS LOCATED CLOSE TO CENTER OF CAR

Three major engineering principles combine to give to the new Ford V-8 for 1935 what Ford engineers term the "center-poise" ride. These principles are:

Correct spring suspension, involving equality of front and rear spring flexibility. Proper car weight balance and passenger weight distribution.

Location of passengers close to the center of the car.

Utilization of these in combination, as practiced by Ford engineers, achieves for the new Ford V-8 remarkable improvement in riding comfort without sacrifice of either safety or stability.
