Energetic Person Figures Alleged in Making Up Beds

How many miles does a housewife walk when making a bed? Studies show that the many trips around the bed, which the housewife usually takes in making it, are the reason the task is longer and more tiresome than necessary.

At least four miles of walking and 25 hours of time is spent a year in making just one bed by the common household method. With more than one blanket on the bed the distance and time is greater. Multiply this by the number of beds in the house to see how this job uses time and energy.

One-trip bed-making to save the long trek has been suggested. The distance can be cut from four miles a year to about a mile and a fifth and the time from 25 hours to less than 16. Briefly, the system is simply to make up one side of the bed completely, then to tuck in at the foot, and then to finish the other side, with no return trips from side to side or head to foot.

If the house of tomorrow is equipped for time and labor saving, beds may be built for easier making. Studies show that a bed 70 to 76 inches, with mattress at wrist height, and no head or footboard or other projections over the mattress can be made up most rapidly.

Pointers for Baby Sitter And for Parents Outlined

Baby sitting can be a career. That is the opening statement in a circular, published by the extension service at the University of Maryland, which outlines suggestions for both the sitter and employing mother.

Know what time you are to arrive. Only illness should cause a break in the engagement. It is a job not a date, don't raid the icebox, and know how and what to feed the baby or child. A few of the hints offered for the sitter's consideration: Equally pointed statements are called to the parents' attention.

Also featured is a baby sitting safety record chart on which the sitter and the mother can check 20 items to be guarded against and a list of recommended reading on child care is included for the sitter's study. The bulletin summarizes some of the advantages of a baby sitting career by saying: "Besides giving the community a service, earning money and observing many practical skills in child care training, you become aware of the many tasks of the successful homemaker."

Jean Mackenzie Heads IOE Chapter This Year

Jean Mackenzie was elected Regent of Countess of Strathmore Chapter, IOE, at a meeting of the Chapter on Monday. She succeeds Mrs. Wallace Thompson.

1952 officers of the organization are: Jean Mackenzie, regent; Mrs. Sam Mackenzie, vice regent; Mrs. H. J. Newman, 2nd vice regent; Hilda Erwin, secretary; Mrs. William Hamilton, treasurer; Mrs. James Linton, standard bearer; Mrs. James F. Evans, educational secretary; Marjorie Gault, Echoes secretary; Ruth Evans, Immigration; Mrs. Garfield McGilvray, press; Ann Hickey, films and Empire study; Mrs. Ed Hall, Mrs. Graham Farnell, services home and abroad; Mrs. Percy Leale, wool convener; Mrs. Robert Stewartson, clinic; Helen MacDonald, flowers and social.

Forty-five members were present at the meeting at the home of Misses Jean and Margery Mackenzie. A minute's silence was observed in memory of the King and members pledged their loyalty to Queen Elizabeth. Members are required to wear a purple ribbon with their pin during the period of mourning.

Annual reports were read by the secretary and treasurer, Hilda Erwin and Mrs. Art Scott, followed by a review of the year's work by the secretary. The Valentine dance was postponed until February 22nd.

Mrs. H. J. Newman was appointed a representative to the Local Council of Women. Ten dollars was

voted to Hinton Music Festival. It was announced that the Royal tour film would be shown in Georgetown next month. Several letters were read from pupils of the Chapter's adopted northern school expressing thanks for gifts and especially the View-Master and reels sent at Christmas.

Mrs. Wallace Thompson thanked members for their cooperation during her two year term as regent, and was presented with a cup and saucer in appreciation of her work by Ann Hickey, Mrs. Edwin Wijnand and Mrs. John Frost. Mrs. Wijnand and Mrs. John Frost were welcomed as members of the Chapter. Hostesses assisting the Misses Mackenzie, were Mrs. J. Gillis, Mrs. J. Linton, Mrs. Harold Hancock, Mrs. J. Inglis, Mrs. G. Farnell and Mrs. A. Scott. The March meeting will be held at the home of Mrs. Arthur Beaumont, Glen Williams.

BREACH OF PROMISE CASE ON FEB. 22nd

Money seems to be no object to some people. That is the conclusion we have reached when we hear the names of eminent counsel that is being "imported" for the Breach of Promise case on February 22nd. We are glad it is an evening session, as that will enable us to go. Why is it that love affairs, whether in calm or storm make us curious?

Care of Shellacked Floors

Outlined by Specialist

"All floor finishes, oil, seal, varnish and shellac—should be waxed every four or six months," advises Alice Peavy, API extension home management specialist.

However, she warns that shellacked floors should not be waxed with preparations containing water. Use a paste wax on shellac.

Instead of a water emulsion wax, Mrs. Peavy says that all you have to do is sweep and dry mop them. For dry mopping use a soft cotton floor mop kept barely dampened with a mixture of three parts kerosene and one part paraffin oil. When the mop gets dirty, wash it out in hot water and soap, dry it and dampen it once more with the kerosene and paraffin prescription.

When a spot of dirt on your floor stubbornly resists simple mopping, go after it with a pad of fine steel wool dipped in turpentine.

If the finish is a floor seal, you will occasionally come across gray spots which have been caused by water standing on the floor for a time. Turpentine does not help in removing these spots. Instead, sandpaper the spot away, patch it up with floor seal, and buff it smooth again with steel wool.

Flies' Resistance to DDT Tested by Entomologists

In many localities of California house flies have developed such a resistance to DDT that 50 times the normal amount is required to kill 95 per cent of them. That was indicated by experiments carried out by the University of California college of agriculture in a search for an explanation as to why DDT no longer gives satisfactory control over flies.

Dr. James R. Douglas of the division of entomology and parasitology compared DDT's effectiveness on a strain of flies from a DDT treated dairy near Fresno with a strain of flies which for two and a half years had been reared in the laboratory. The laboratory insects alone died quickly when tested, proving that the fault does not lie with the chemical, but imply that the other insects developed a resistance, and had been observed previously with other insects.

Dr. Douglas is now studying the use of other chemicals for control of flies. Because of possible variations in resistance of these chemicals it is not yet possible to say which of them will give best control in a particular locality.

Soil Protection Crop

Annual lespedeza is a crop which can be used both for forage production and soil building. Lespedeza is usually seeded into the grain in early spring. It continues to grow after the grain has been harvested and can then be cut for hay, or left for seed which may be harvested late in the fall. Another alternative is to leave the entire crop on the land and turn it under in preparing the land for cotton. As a soil protection crop, lespedeza provides cover on the land during the winter months, thus retarding erosion. It adds organic matter to the soil and, being a legume, it lessens the need for commercial nitrogen.

Deer, Barometer of Soil

The weight of deer reflects the condition of the country they live in, weight records of 10,000 deer collected by the Wisconsin conservation department during the last decade show. The records show that deer average lighter in weight in central than in northern Wisconsin, believed to reflect the poorer soil conditions of central Wisconsin. Average deer weights show a gradual decrease over the last 10 years on ranges characterized as poor while on ranges listed as good, deer weights do not show the downward trend. In all cases the deer were weighed after being dressed out. The department listed the deer according to the type of range they came from and it was found that deer from the good ranges out-weighted the deer from the poor ranges.

Breakfast, Important Meal

People who are careless about their breakfasts may ask whose business it is if they choose to live that way. But it does concern others. Ill nourished people are not at their best, and in this machine age they jeopardize the safety and lives of others. Children in families which start off the day with scanty or unappetizing breakfasts are off to a bad start for school or work. This continually deprives them in their growing years, they fail to build the stamina necessary to resist disease and premature aging. There is no end to the ills of a people who cheat their stomachs at the first meal of the day.

Laughing Gas in Atmosphere

Laughing gas, an anesthetic widely used by dentists to put their patients to sleep, has been found in the atmosphere. R. L. Slobod and Milton E. Krogh of Dallas, Texas, announced at meeting Southwest of the American Chemical Society. The gas, known to chemists as nitrous oxide, or N₂O, makes up only one part in two million of air, the report stated, explaining that examination of sunlight with the spectroscopic had previously suggested the presence of nitrous oxide in the earth's atmosphere. Laughing gas is colorless and has a sweet odor. A whiff will make a man giggle, and more will put him to sleep.

Facts About Pole Star

The pole star changes. Owing to an effect called precession of the equinoxes the point in the sky directly over the north pole shifts in a circle among the stars. The star in the little dipper which we call the Pole star is merely a transient occupant of that post. In the future we will have other pole stars. For example, the other pole star, for example, the constellation of Cepheus, will be there about 7,500 A. D., and Vega, 23,000 A. D. Thuban, in Draco, will again be the pole star, as it was around 3,000 B. C., when some of the Egyptian pyramids were built.

Ghost 'Airports' in Peru

Pilots aboard Peruvian International Airways planes find it difficult to convince passengers flying over Peru's limitless plains that the "airports" they spot aren't really airports. Looking exactly like giant runways criss-crossing Inca-land, the age-old marks are actually the remains of gigantic calendars that were constructed by pre-Inca peoples to mark the changing seasons. In the dry, windfree area they remain plainly visible after thousands of years.

Underneath Roofing Protects

Hall roofing unrolled on the soil under houses without basements, announced two years ago by the U. S. department of agriculture as a means of reducing moisture and preventing rot of floors and timbers, now proves to have other effects, including rust prevention, in preserving houses. Heavy roofing is recommended (85 pounds to 100 square feet or heavier). The method has been found desirable when adequate sub-floor ventilation would interfere with the warmth of the house.

Moisture in Ash Tray

What causes the moisture that appears in an ash tray, particularly a metal one, as a cigarette burns in it? All burning of paper, gas, wood, and similar materials, containing a considerable proportion of hydrogen, produces water, formed by a combination of the hydrogen with oxygen from the air. Ordinarily this escapes from the cigarette as invisible vapor, but if the ash tray is cool, it condenses to form visible moisture.
