GRADUATE

Georgian College President Robert Crawford congratulates Leanda Ruth Farley of 16 Chelvin Dr. Georgetown, during Convocation exercises held for graduates of the College's Health Sciences Division, Orillia. Leanda graduates from the two-year Mental Retardation Counsellor Program which qualifies graduntes to work with developmentally handicapped persons in small or large agencies, in community residences, and with community groups.

Reservoir dedicated to first works director

Halton regional chairman Ric Morrow and members of regional council were on hand last Wednesday for a dedication ceremony to mark the official opening of the Bailie Reservoir, north of Upper Middle Road in Burlington, named for Halton's first director of public works.

Robert Bailie was public works director for the city of Burlington from 1958 to 1973 before becoming Halton region's chief engineer when regional government was introduced here in 1974. He dled

suddenly the following year,

Mr. Bailie's widow and children unveiled a commemorative plaque at the new facility Wednesday while Mr. Morrow, former Halton chairman Allan Masson and current public works director Bob Moore looked on. Halton board of education chairman Rev. Gary Morton, who is minister of the Burlington Presbyterian Church of which Mr. Bailie had been an elder, conducted a brief devotion.

With its 3.86-million gallon

capacity, the Bailte Reservoir will ensure steady water pressure to Burlingotn residents living between the Upper Middle Road and the Queen Elizabeth Way. Water will also be pumped to the Beaufort Reservoir near Milton.

er expansion as needs dictate to hold seven million gallons and has an ultimate pumping capacity of some six million gallons per day.

spelled out," said Mr. Elliott.

Special to The Herald

Wintario officials have concluded that the application by the Acton Town Hall Restoration Committee (ATHRC) for funds to restore the exterior and structural security of the Acton town hall is incomplete.

Wintario made the decision last week after a meeting with committee representatives and representatives from Halton Hills council.

Though Wintario didn't flatly reject the application for 1-3 of the \$104,000 cost of restoring the exterior and structure, sald George Elliott, chairman of the ATHRC, the funding body found the applicatlan lacking in several areas.

Winterlo wants clarification on who would manage the town hall if restored, on the exact position of the hall's owner (the town of Halton Hills) the management cost for the hall if restored, what the hall would be used for and who would operate the hall.

"They said that they

MELE TUNED CAR COULD KEEP YOU HAPPY ON THOSE FALL TRIPS!!!

Don't blame battery for won't-start Ignition system condition prime factor when starting

The condition of the ignition system, not the battery, is the most intportant factor in winter starting.

When other engine components are not properly maintained, even a new or well-charged battery can quickly be worn down before the engine starts.

The voltage required to start a car increases when the engine possesses such maladies as broken or cracked ignition cables, worn spark plugs or plugs with wide gaps, a worn distributor cap or rotor, or corrosion in the distributor cap, David L. Walker, director of Champion Spark Plug Company automotive technical services department, said.

These problems are compounded, he said, during wet or cold weather and the components require even more current

to achieve useful operation.

"Electricity, like water, seeks the easiest path along which

components, interrupts or

already diminished electrical

Voltage available

The voltage available to

start a car decreases when

there are worn breaker points

or a faulty condenser, coil, or

primary dropping resistor.

Cold temperature also ad-

versely affects the capacity

of the battery to produce

necessary cranking power for starting. At 80° Fahr-

enheit, a battery has its

maximum capacity. This

drops to only 60 percent of its

potential power at 32", and

slides to just 46 percent at 0°

weather, the battery may not

generate enough power to

start the engine, but this is

not necessarily the battery's

fault. This condition is fre-

quently caused by worn igni-

tion parts requiring more vol-

tage than they would if prop-

to flow, Faulty wiring, or any deficiency in the ignition

Let emissions controls do job—EPA

or its franchised dealers.)

Tampering will not boost mileage; is costly, illegal

By Marvin B. Durning Assistant Administrator for Enforcement, EPA

Time was, when we shopped for a new car the only thing we cared about was how big it was and how fast it would go. Out of that era of automatic gears and reclining seats came an air pollution

problem. The amounts of carbon monoxide, hydrocarbons and nitrogen oxides blowing out of automobile tailpipes contribute more than onehalf of the man-made air pol-

Recognizing the effects of automobile emissions on the health and welfare of the nation. Congress passed a law which requires manufacturers to produce cars that will reduce the emissions. Auto makers have done this by installing pollution control equipment which will greatly improve the air quality.

Proper care important

But the auto owner must realize that proper care of that equipment is every bit as important as the care we so generously lavish on the rest of the automobile.

Since August 8, 19/7, all automobile service or repair facilities have been prohibited by Federal law from knowingly tampering with a

car's emission controls. This new law provides a significant legal reason why you should not ask your automobile repair facility to remove or disconnect some. part of your car's emission control system in hopes of improving gas mileage or driveability. If a repair facility breaks this law, it is subject to a civil penalty of up to \$2,500. The penalty is up to \$10,000 for automobile manufacturers and dealers. -

Reasons not to tamper In addition to the law, there are other good reasons why tampering should not be done:

· In most cases, lampering

will not improve a car's gas

mileage or driveability, and may make them worse. . The one certain result of tampering is that it will increase your car's emissions

and add to air pollution. · Tampering is an expensive waste, nullifying emission controls that on a new model car may have cost you

between \$200 and \$300. Another important point is that the law does not contain a prohibition against car owners tampering with their curs' emission controls. But nearly all states do have such a prohibition. You can be prosecuted and fined under many state laws for any tampening that you do to a car's

pollution controls. Tampering is removing. disconnecting, damaging, or in any way rendering ineffective any emission control device or element of design installed on a motor vehicle or motor vehicle engine.

Tampering may include: · removing or rendering inoperative such devices as the catalytic converter, hir

pump, and EGR valve. · disconnecting vacuum lines and electrical or mechanical portions of the pollution control system

such as electrical solenoids or vacuum-activated valves. · adjusting an element of a car's emission control design out of line with the manufacturer's specifications.

· knowingly installing a replacement part that is not equivalent in design and function to the part that was originally on the car. Exam-ple: incorrect EGR valve. (This, however, does not mean that you have to use replacement parts sold by the motor vehicle manufacturer

· adding on a part that was not originally certified on the car. Example: installation of dual carburetors to replace a single carburctor.

· enlarging the fuel filler restriction inlet to allow the use of regular leaded gas in cars that require unleaded gas.

Gas mileage suffers

Contrary to the belief of some vehicle owners, the catalytic converter, a major means of pollution control on most cars made after 1974. has no negative effect on gas mileage and driveability.

In fact, the catalyst has helped make it possible for cars with emission controls to achieve the same or even better gas mileage than cars had in 1967, before emission controls were installed on

Maintaining your car according to the manufacturer's specifications will almost always enable your car to get better gas mileage and lower emissions.

In addition, keeping your car well tuned will almost always improve driveability and lengthen the life of your car's engine.

Under the Clean Air Act, car manufacturers are required to provide a warranty covering emission control devices for a period of five years or 50,000 miles. whichever comes first.

However, when a car's emission controls have been tampered with, or when leaded gas is used in cars requiring unleaded, a car manufacturer may not be obliged to honor warranty rights. The car manufacturer or dealer can justifiably argue that the car has not been properly maintained according to the manufacturer's spec-

ifications. The emission controls installed on motor vehicles and motor vehicle engines are there to reduce the pollution from these sources to help meet national ambient air quality standards which were established to protect public health. The removal or rendering inoperative of these

devices defeats a vital portion of the nation's program to clean up the air. You can help clean the air by not requesting to have your emission controls tam-

pered with, but instead. make sure the mechanic follows the specifications recommended by the manufacturer for best performance and emission control.

Before winter sets in. . .

Soak up the joys of the open road

When the autumn leaves begin to turn and the air gets that certain nip, it's time for one last outing before the "winter blahs" set in.

Fall grinway Whether planning a weekend in the country to observe the fall foliage or a family car trip to visit a faraway relative, a bit of foresight will help make your excursion all the more pleas-

Since much fall travel is carried out within the confines of cars, buses and trains, it's important to pack along a number of "antiboredom" devices to ensure a good journey. Today, many board games

boards, which are perfectly suited for nice long trips on rhythmically swaying trains and in cruising cars. It's not always necessary to bring carry-along games: for energetic groups, there exist an array of word games as old as long distance travel itself. A rousing round of

voltage-required and voltage-available factors.

Test two cars In the tests, Champion engineers attempted to start

cars at 0° F. Two cars were purchased "as is" from used car lots. One of the cars, a Chevrolet Camaro, had conventional ignition system. The other, a Dodge, had cleefrome ignition.

Before undergoing cold room tests, both cars were able to start in normal warm weather conditions. Then they were "soaked" in the 0° cold with the following re-

The Dodge with its original battery and engine condition did not start in four 30. drains away the flow of an second attempts. A new battery was installed, but a new supply. Also, worn spark starting attempt was still unplugs easily require twice the successful. electricity as new ones," Mr.

Technicians then tuned the car, replacing the old spark plags with new ones, resetting the timing to factory specifications and replacing distributor components. Using the original battery, five new starting attempts averaged starts in 2.67 sec-

In the tests on the Camaro, with the battery and engine in "as is" condition, there was one "no start," one start after 9.52 seconds and one start at 2.31 seconds.

' Remote control

With a new battery installed, average time to start was 9.87 seconds in eight attempts. With new spark plugs and the original battery, average starting time was 1.67 seconds. With the engine tuned and the "old" battery, starting time averaged 1.75 seconds.

All tests were conducted by remote control to assure that driver habits did not af-
