

USING JUST A SCREWDRIVER, do-it-yourselfers can quickly install automatic energy savings with Robertshaw's new electronic Energy Manager² to replace old thermostats. This combination heating/cooling thermostat automatically delivers economy on fuel/energy bills with pushbutton programming, seven days a week.

New thermostat installs quickly, saves on heating/cooling bills

Any home handyman can easily install a new electronic Energy Manager thermostat, and enjoy its automatic setback programs for savings on costly energy bills, year after year.

Using simple pushbutton controls, you can set money-saving schedules to cut back on heating (or cooling) when you don't need it. Energy Manager will return your home temperatures to comfort levels when you want them...automatically.

With its digital speed and accuracy, this electronic thermostat gives you the ability to match energy-saving economy to your lifestyle.

For example, you can program one setback period for sleeping hours, and another when everybody's away from home. Energy Manager automatically brings your home back to comfort temperatures when you need it.

This "thermostat with a brain" even calculates the best start-up time so your heating (or cooling) equipment will reach comfort levels at the right time.

Complete programming

You can enter multiple setback programs for each day of the week with Energy Manager's pushbuttons and information display window. Programs

may be repeated each day, and can be easily changed or canceled.

Different programs for weekdays and weekends, holidays and vacations, can be easily entered. And a backup battery will store your programs for three days in case of power outages.

You can easily replace your old low voltage thermostat with various models of the Energy Manager. Different models are available for automatic, money-saving control of air conditioning, heating or combination heating/cooling systems, including heat pumps.

Each thermostat has an owner's manual with step-by-step illustrated instructions that make installation an easy do-it-yourself project. Your new thermostat will cover the old mounting location. No leveling or added wiring is needed.

Save up to \$300 on heating

Dollar savings of up to \$300 on heating bills of \$1,000 per season are possible (ASHRAE Journal Studies, 1978). Your actual savings will depend on your lifestyle, type of equipment and insulating factors in the home, as well as the climate.

Energy Manager cuts back on your fuel and energy usage by automatically lowering (or raising) your home's temperature according to your programs.
