

We know, WE'LL BE

Cancer

KIDNEY

Kidney cancer occurs in either of the two kidneys, which are part of the urinary system. The main function of the kidneys is to filter water, impurities, and wastes from the blood. There are several types of kidney cancer, the most common being renal cell carcinoma.

LEUKEMIA

Leukemia is a cancer that starts in the stem cells of the bone marrow. Bone marrow, which makes blood cells, is the soft, spongy material that fills the centre of most bones. Leukemia develops when the blood stem cells produce abnormal blood cells. Over time, the leukemia cells crowd out normal blood cells, making it hard for the white blood cells, red blood cells, and platelets to do their jobs.

LIVER

Primary liver cancer starts in the cells, bile ducts, blood vessels, or connective tissue of the liver. It is uncommon and is different from secondary liver cancer or metastatic liver cancer, which spread to the liver from other parts of the body. Most primary liver cancers begin in liver cells called hepatocytes, and the most common type is hepatocellular carcinoma.

LUNG

There are two main types of lung cancer: small cell lung cancer and non-small cell lung cancer, which is the most common and slower-growing type. Small cell lung cancer grows quickly and often spreads to distant parts of the body. Lung cancer is the leading cause of death by cancer in both men and women.

OVARIAN

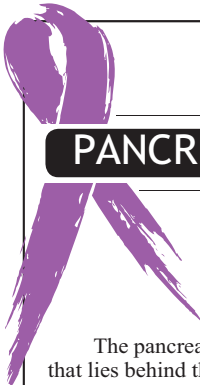

There are three main types of ovarian cancer. For each type, the cancer starts in a different type of cell found in the ovaries:

- epithelial cell cancer starts in the cells that cover the outer surface of the ovary;
- germ cell tumours start in the egg cells within the ovary and generally occur in younger women. Germ cell cancer can even develop in children.
- Stromal tumours start in the connective tissue cells that hold the ovary together.

PANCREATIC

The pancreas is a large gland that lies behind the stomach, deep inside the upper abdomen. The pancreas is part of the digestive system and is also part of the hormonal system, for which it makes insulin and other hormones. Most pancreatic cancers start in the ducts that carry pancreatic juices.

PROSTATE

The prostate is part of the male reproductive system. This gland's main function is to make seminal fluid, which mixes with sperm from the testicles to make semen. Prostate cancer is the most common type found in men. It usually grows slowly and can often be cured or successfully managed. Nevertheless, prostate cancer is the third leading cause of death by cancer in men.

SKIN

The most common types of skin cancer are squamous cell cancer and basal cell cancer. Both are known as non-melanoma skin cancer and can usually be treated successfully.

STOMACH

Stomach cancers can start in the lymphatic tissue (lymphoma), in the stomach's muscular tissue (sarcoma), or in the tissues that support the organs of the digestive system (gastrointestinal stromal tumours). They are treated in different ways.

TESTICULAR

More than 90 percent of testicular cancers start in germ cells, which are the sperm-forming cells within the testicles. Other types of cancer can spread to the testicles, at which point they are called testicular metastasis. It is the most common cancer to occur in young men who are between 15 and 29 years old.
