Constantine Karolidis is a Hearing Instrument Specialist with over 20 years of experience and owner of Halton Audiometric Centre at Unit 44, 360 Guelph Street.

## A hearing loss is more visible than a hearing aid

More than half of Canadians over the age of 65 will experience some degree of hearing loss; yet, the average person has trouble hearing for seven to 10 years before having their hearing examined by a hearing healthcare professional.

Living with hearing loss can be frustrating, even dangerous.

Hearing aids can allow us to function better in all areas of life. A person wouldn't put off getting glasses if they were having trouble seeing.

Hearing loss is not something one should just "put up with." In fact, research shows early treatment can make a difference.

There are many reasons why patients continue to suffer with hearing loss, such as cosmetics and how certain hearing aid features can improve every-

day life.

Today's technology allows us to fit a large number of people with cosmetically appealing and in some cases "invisible" hearing aids with features that allow wireless connectivity, and advanced circuitry to improve hearing in noise like never before.

If you or a loved one:

- Often ask people to repeat themselves
- Have trouble understanding what's being said
- Have trouble hearing in noisy situations
- Often complain about people mumbling
- Experience persistent ringing in your ears

Visit your Hearing Instrument Specialist today to have your hearing tested.
