Avoid the big chill with a tankless water heater

At a time when energy conservation is at a premium, we are seeing a combined new technology in an innovative way to heat water.

The Tankless Water Heater utilizes advanced technology for energy efficiency and supplies low-cost, continuous hot water on demand.

Thanks to the Tankless Hot Water Heater, when some family members take long showers don't worry about the big chill when it's your turn. You'll never run out of hot water again since this system provides endless hot water, at a constant rate and temperature. A product for the environmentally-conscious household, the Tankless Water Heater uses energy to heat water as needed—no wasted energy when there is no demand for hot water.

In addition, this product puts you in complete control over your water temperatures with a precise, easy to use digital controller. This is a great safety feature, especially if you have children in the house. This heater adds considerable savings to your energy bill.

Features and benefits

- **Continuous hot water on demand:** Tankless Water Heaters provide a steady flow of hot water whenever you need it. Compact in size and a real space-saver; indoor or outdoor models can be mounted to any interior or exterior wall.
- **Environmentally-friendly:** This product meets low emission standards due to advances in operational design and high efficiency.
- **Digital display:** All models have a digital display that clearly shows temperature and adjustment settings.
- **Remote controls:** Available for all models to add convenience to the system

so settings can be changed throughout the house.

- **Worry-free operation:** An award-winning tankless design features exclusive safety features, such as built-in self-diagnostic program, automatic shut-off and advanced sensors that prevents over-heating.

- **Overheat limiter wrap:** On all models a resin film is wrapped around the heat exchanger for the earliest possible detection of unsafe overheating.

- **ICAD:** A proprietary safety system that constantly monitors combustion for evidence of unsafe carbon monoxide.

- **Plus:** A 10 year warranty on heat exchanger; three year limited warranty on parts from energy efficient leaders in the industry for more than 70 years.

Picture this: Your whirlpool tub will hold 60-80 gallons of water or a multi-head shower uses 10-15 gallons of water per minute. A five-minute shower therefore uses upwards of 50-75 gallons of hot water. Filling this bath or taking this shower will use up the supply of your everyday hot water tank with only cold water left for everything else.

Imagine not having to worry about these numbers but enjoying a hot shower without wasted money or environmental issues weighing on your conscience? Tankless Water Heaters are the smart way to use energy resources since gas is used to heat water only when you need it. The conventional tank type water heater keeps burning fuel when you're not using it. So the next time your shower turns in the big chill wonder about the benefits of burning gas to heat your water when you weren't using it.

Thank You For Your Support, Georgetown!

Thanks for supporting our amazing growth!

This BBQ was a way of showing our appreciation and it was an overwhelming success.

Thanks for everything, Georgetown
