The lens of the eye just behind the pupil, known as the crystalline lens, is about one-third inch in diameter and weighs about four grains, it is constructed of concentric layers like layers of an onion, it is transparent and elastic.

Any loss of power or the removing of the crystalline lens requires glass lens to make up for it. We have every facility for testing the eyes, fitting eye glasses and spectacles, and grinding lenses, in many cases repairs be made while one waits, prescriptions are filled with the greatest care and accuracy.
