Party of College Experts On Trip to Canadian Rockies Find Many Interesting Features

Professor W. G. Waterman of the botany department, Northwestern University, spent the month of August in charge of a party from the Geographic Society of Chicago on a trip to the Canadian Rockies and the "Panhandle" of Alaska. There were no students in the party but Professor Waterman was able to continue his studies of mountain vegetation and glacial moraine plants.

**In Canadian Parts**  
 The party went to the coast over the Canadian Pacific Railway, stopping at Banff and Lake Louise in the Rockies and at Glacier Station in the Selkirk. Several days were spent visiting the forests and flower gardens of Vancouver and Victoria, followed by a five-day steamer trip through the inland passage to Skagway and back to Prince Rupert, B.C. Two days at Skagway were given to a trip over the White Pass and Yukon Railway over the famous White Pass to West Taku Arm and return. From Prince Rupert the party returned by the Canadian National Railway to Jasper Park in the Rockies, 150 miles north of Banff. From Jasper Park, four of the party spent six days in the wild and beautiful country around Mt. Robson and then returned to Chicago by way of Edmonton, Winnipeg and Duluth.

**White Pass Region**  
 "The two points of greatest interest were the White Pass region in Alaska and Mt. Robson," reports Prof. Waterman. "The White Pass and Yukon Railway follows the trail of the Klondike miners in the Valley of the Skagway River and along the famous White Pass trail. The railroad climbs 3,000 feet in 20 miles and it is unsurpassed among mountain railroads for wildness and interest of scenery. From the summit of the pass, a rocky plateau extends north for thirteen miles and then the route gradually descends to Lake Bennett, the head of navigation for the Yukon Valley. The vegetation of this plateau is similar to that of the rock tundra of the Arctic Barren Lands and it is also reminiscent of the Scotch Highlands. A day was spent on this plateau photographing and studying the sub-arctic vegetation, which consists of stunted fir and juniper, heather, low flowering plants and lichens.

**On Mount Robson**  
 "At Mt. Robson, the party rode twenty miles on horseback from the Canadian National Railroad around the foot of Mt. Robson to Berg Camp. Mt. Robson is 13,300 feet in height and rises 8,000 feet above the Valley floor. It is surrounded by a labyrinth of mountains and valleys, many of which carry extensive glaciers and the region affords an unusual opportunity for studying the development of vegetation or glacial moraines.

"As was observed in Glacier Park, Mont., in 1923, the glaciers of the northern region also have retreated considerable distance in the last five or six years. As these glaciers are of great extent there is no danger of their disappearing in the near future."

**Climb Glacier**  
 The party climbed two miles over the lower end of Coleman Glacier, but learned that it extends twenty-five miles into the mountains and that no one had ever traversed its whole length.

"The forests around Mt. Robson are somewhat scanty as the valley floor is nearly up to timberline," the professor said. "At lower levels near the railroad the forests are more luxuriant and the trail passed through splendid stands of western cedar, hemlock, and spruce."

Dr. Waterman will lecture upon the more interesting features of his recent trip at various times during the current college year.

1000	1.07	0.97
1200	1.93	0.87
1400	2.65	0.81
1600	5.15	0.92

IDENTICAL panels with frames four feet high and eight feet long, constructed with sills and studs 7 1/2 x 3 1/2 in. and studs placed 16 in. on centers, were prepared. FRAME A had one side covered with 1/2 x 6 in. dressed sheathing nailed at each stud with 8D nails, and the other side covered with common lath spaced 2 in. on centers and staggered in the usual way. FRAME B was covered on both sides with Expanded Wood Lath sheets 8 ft. long and 16 in. wide, fastened at the juncture of each rib and stud with 6D nails. In testing these panels the bottom sill was clamped to the base of testing machine and the pull applied to the top sill in the direction of its length. Expanded Wood Lath, by this test, has been proven much stiffer than the old standard construction. But added to this advantage are its high insulating qualities and the much lower construction cost when used for either exterior stucco or interior plaster.

**Automatically Backplasters**  
 between the lath and asphalt felt. Not an ounce of material wasted. You get the intrinsic value and strength of every ounce used.
