Home Beautifying and Landscape Suggestions

Handling Wet and Soggy Places by Drainage

In order to be sure that all the seep water is cut off from your yard, it is necessary not only to drain the low places but along the side hill as well. Drain on heavy clay soil should be placed not more than thirty feet apart. On sandy soil forty or fifty feet is close enough. Where ordinary farm tile are used, they should be put in not less than two feet, in order to prevent frequent freezing and thawing and the crumbling of the tile.

The drain should be taken to a natural outlet or to a catch basin. If there is not plenty of fall or water to level with, an instrument or level should be used. Two or three inches per hundred feet is very ample.

Selecting Your Perennials for the Border

The first row on the border should contain low plants such as Pansies, Rock Arabis, Tunica, Dianthus Caesius, Campanula Carpatica or any other low growing perennial.

The second height perennials are Ranunculus (Buttercup) Pyrethrum, Canterbury Bell, Aquilegia, Sweet Williams, Shasta Daisies,

Dwarf Chinese Delphinium, Oriental Poppies, Anthemis, Linum Perene (Flax), Achillea, Agrostemma, Hardy Carnations, Centaurea Montana, Double Coreopsis, Gaillardia, Lupines, Stokesia, Scabiosa, Veronica, Lychnis, Platycodon, Gypsophila and Day Lillies. The Widar, Wanadis and Lumbineaux also Miss Lingard Phlox go well in this second border.

The next series of plants in the border, should be of height ranging from twenty-four to thirty-six inches, which include the tall varieties of Phlox such as Jeanné D'Arc, Henry Murger, Viking and Riverton Jewel, Hemerocallis, Citrinna, Artemesia Lactifolia, English Hybrids, Delphinium, Rudbeckia Purpurea, Japan Lillies, Aconitum, Peonies, Foxglove, Pyrethrum Uliginosum, Siberian Iris, and for the tallest border in the back use the Boltonia, Hollyhocks, Liatris Anchusa, Hardy Asters Rudbeckia Lacinata, Hibiscus, Physotegia.

Commercial Fertilizers and Manures

The question is frequently asked, "what is the best fertilizer I can use." All fertilizers have certain merits and are so mixed in proportions as to adopt themselves best for the purposes they are intended. A complete commercial fertilizer such as Vigoro include all the plant food

that is necessary, but has no humous. Therefore, manure should be used in conjunction with Vigoro, as nearly all soils are deficient in Phosphorus and as phosphorus does not leach or waste by evaporation, a heavy application is economy on almost any soil. Fifty pounds to a thousand

square feet would be a very good and heavy application.

Manure may be used as a top dressing which if well rotted is wonderful for keeping the surface mellow and loose. It may also be spaded in to almost any depth with very good results.
