## Trees Respond to Feeding at This Season

If trees could speak they would probably tell many of us how grossly unjust we are to them when we place them under unfavorable growing conditions, remove the food nature provides, and fail to replace the natural supply.

Soils around city homes are much poorer than those found in forests. And trees in cities are robbed of their natural food when fallen leaves are removed beneath them. Other conditions in cities are unfavorable to their growth: smoky air, poisonous gases, competition with grass and other plants for food and water. Often the ground area from which they must draw food and moisture is partially covered with pavement. Considering these conditions, it is not surprising that most city trees are poor specimens.

Many of these conditions cannot be remedied, but it is possible to supply trees all the food elements they need for healthy, luxuriant growth by regular feeding with complete, balanced plant food. Well-fed trees will thrive even under these unfavorable conditions.

Complete, balanced plant food may be procured at a nominal cost from your dealer in lawn and garden supplies. A pound of plant food to each

inch of circumference of trunk of tree is required. Simple directions for feeding trees and everything you grow accompany each bag.

## Laying the Cornerstone for Next Season's Garden

The cornerstone of a garden must be set into place in the fall. Right now is the time to plan and lay out your garden needs for next season. All bulbs and many perennials should be planted in the fall, leav-areas for tender tubers and annuals for spring planting.

A well prepared and fertilized border is essential for best results. All complete fertilizers, lime where needed, should be added in the fall.

In rearranging your borders it is not necessary to remove all plants. In fact such plants as delphinium, aquilegia, peonies, oriental poppies, lupine, and other plants slow to establish themselves, should never be removed except when replaced by new and young stock. It is entirely an erroneous idea of being able to divide and successfully transplant these old plants in the garden. It requires two to three years to produce plants of this character for planting, when once divided, and few gardens can afford this loss of time for the small saving accomplished.

## FRANKEN'S Tulips have arrived from Holland + + +

Send for our Master List of Tulips

Make your selection while the stock is complete

Following are several collections for your convenience at special prices.

Brighten your garden with these eight very choice Tulips
