AIR CONDITIONING

A Review and a Word of Prediction

CLEANING

* The prolonged intense heat which causes so much suffering throughout the country again makes news of air conditioning. For the past three summers, this has happened. When the thermometer soars people seek air conditioning, appreciate it, talk about it. This year, the interest has been more intense than ever. The reason is obvious - more air conditioning available than ever before. Engineers have been busy producing its effects in a greater variety of forms.

But air conditioning is not news to us We have been interested in it since its inception. We have seen in it, not only new market for our products - gas and electricity - but we have also seen it as the fulfillment of a great human need Another development in the steady prog ress of Americans toward better living.

It is a fact that the majority of the people have come to think of air conditioning as a means of cooling the rooms they occupy . . . a method of relief from the intense heat of summer. But air conditioning, in the true sense, is considerably more than that. It actually includes, in addition to cooling, five other important processes in the preparation of more comfortable air to live in. These processes are circulating, cleaning, humidifying, de humidifying and heating. Although cool ing secures the greatest publicity for air conditioning, it is by no means its only function. Complete installations in theaters, stores, hospitals, public rooms of all sorts-and in many homes-include all six functions.

Just what is the present availability of air conditioning? Simply this: you can have it for your home, your store, your office, your theater, your restaurant -in fact anywhere you want it-in just about

any form you desire. That is, you can have a unit which provides all the functions, or you can have one or more units which produce these effects separately. New buildings are being constructed with complete units. Older buildings and many existing home are adding individual room coolers, air dirculating fans and filters, attic ventilating fans, humidifiers which moisten dry winter air, and other types of equipment.

No, air conditioning is not new to us. We have been working in this field for several years We have assisted in the development of several different units, suggested improvements to manufacturers, pointed out the needs of the ultimate user. We feel that we are abreast with the many fine types of air-conditioning equipment now being offered and in touch with new types being developed.

And now for a prediction. Air conditioning has cally started its job of making our daily lives more comfortable. The next decade may see it reach an acceptance of the proportions that automatic refrigeration has now attained. Beyond that, it may compare with the universality of electric light. We are inclined to agree with the suggestion that has already been made, that in the years to come it may be considered one of the industrial developments that helped will the country out of the depression.

The information we have collected on air conditioning has been helpful to many in the outlying Chicagoland territory we serve, and is wailable to you for the asking. We have engineers who have made thorough staties of this subject, and who can put you in touch with the many qualified dealers in air-conditioning equipment. Inquirest any of our stores or offices.
