Financial Review. Aluminum Alloys.

Dr. A. Roche has recently studied the ohysical properties of the alloys formed by mixing aluminum and antimony together in various proportions, with interesting results. The alloys containing less than 5 per cent. of antimony are harder and have greater elasticity and ductility than pure aluminum. Their color, however, is not so white as that of the pure metal, but they take a better polish and resist atmospheric action in a greater degree. When more antimony is added to the aluminum the elasticity rapidly diminishes, as does also the hardness, and the allow soon becomes brittle. The characteristic crystalline condition of the metal also undergoes a very marked change, and when the amount of antimony reaches 10 per cent. the alloy forms shiping crystalline plates. The addition of antimony, as might be
