Diversional therapy lessons given chronic hospital patients

By Janet Braida

The old phrase "live fast, die young" has been kicked around through many a generation. Nowadays with our medical and mechanical discoveries, our successful kidney and heart transplants, people live longer and die harder. If you are growing old and can barely walk you feel no-one cares.

The Women's Auxiliary of Milton District Hospital saw hurt and depression troubling the chronically ill at their hospital so they decided it was time they looked into the problem. "Diversional therapy" was the plan they came up with; a plan that would "guide, teach and interest the aged-making them forget their own problems and be away from their hospital

The plan first started on Nov. 13, 1969, with Mrs. Diana Kempe, a former lab technician who learned about making crafts from her mother. Mrs. Kempe was in charge of the group of volunteers at first but has since moved to Australia. Mrs. Kempe set about and gathered simple materials and crafts that could be used by the old, especially those who were limited in their activities due to heart attacks, ailments or strokes.

Today more than half a dozen of the chronically ill are learning to paint water colors, do puzzles, make Christmas decorations or mosaic ashtrays.

The group meets from 1:30 to 3 p.m. every afternoon with one volunteer on hand daily to assist with the crafts. "At Christmas the group used styrofoam balls, ribbon and decorations to make ornaments for the hospital," said

Mrs. Brian Best. "And at Easter they made Easter bunnies from styrofoam with knitted legs and heads. Upon completion they filled the bunnies with candy and sold them in the gift shop, gave them to grandchildren or kept them for themselves. They are very proud of everything they make," she said.

Under the new direction of Mrs. J. Ackerman physiotherapist at the hospital. the group of volunteers include Mrs. John Ostler, 435 Campbell Ave.: Mrs. Brian Best, R.R. 6 Milton; Mrs. Edwin Joyce, 171 Heslop Rd.; Mrs. W. J. Hawkins, 301 Bell St.: Mrs. John Conway, R.R. 1 Milton and Mrs. George Hood, Parkway Dr. These six regulars work one day a week or one day every second week.

"It's the mental attitude of the patients that really counts," said Mrs. Best. "If the patient has the will to keep busy he can put forth enough effort to do

"It gives them a lift to see other people at work and many young people come to the classes just to keep busy and keep from getting bored. We run a class five days a week but if someone is too tired or just doesn't feel like coming, they are not obliged to do so," she

the supplies for the therapy class come from the art shops. Much of it is leather, mosaic, thread and ribbon and art supplies. "One man even made his own leather case for his glasses as well as card holders, a teapot stand and a wallet. The women in the class usually paint, make raffia flowers (made from various colors of coarse thread) or knit.

"The men go more for the mosaic ash trays than the women," said Mrs. Best. "The women don't like to get their hands dirty."

25 enjoy tour Niagara blossoms

Twenty-five tickets were sold in Milton for the Blossom Bus Tour held Sunday, May 17. The tour included a day's travel down through the Niagara Penninsula to see the blossoming fruit trees.

"Only one busload took the trip this year and enjoyed every minute of it," said local ticket agent William Casson, "As well as seeing the blossoms, the group also saw a Canada Steamship docked in the Welland Canal and a procession of 150 old cars sponsored by the Niagara Peninsula Car Club.'

"All in all I believe everyone enjoyed the day's outing." Adult tickets for the trip cost \$5.75; children's \$3.25.

When selecting a new refrigerator allow eight cubic feet of capacity for a family of two, plus one cubic foot for each additional member and two cubic feet for entertaining. If the household is composed entirely of adults and teenagers, two cubic feet for each additional member is better.

Power People - Chemists

With these eight turbo-generators running, Hydro's R. L. Hearn power station uses over half a million gallons of water a minute. The station chemist is responsible for its purity. All water used is pure enough to drink; some exceeds the standard of purity required for use in medical serum.

Chemists play a key role in the operation of Ontario Hydro's thermal-electric power plants. All coal-fired and nuclear stations have a laboratory and a staff of chemists. The sampling and analysis of incoming coal to determine its heating value, sulphur and ash content is one of the more important duties. Hydro bought some \$45 million worth of coal in 1966.

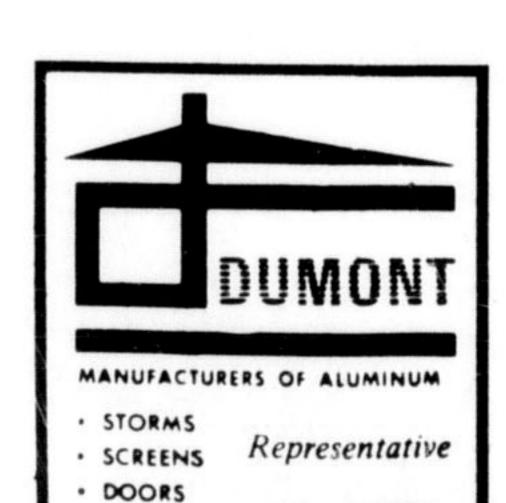

A constant check on the condition of cooling water must also be made to protect and maintain efficiency of equipment. In full operation a modern thermal station uses as much as a million gallons of water a minute plants. for cooling purposes. If uncontrolled, algae in this water can coat the inside of piping and equipment

water is returned to its source un-

Chemists also supervise and maintain a supply of water for use in the boilers, where anything less than "super-purity" causes scale and corrosion. The control of corrosion in many forms is another all-important duty of the station chemist. Unchecked these forces can literally eat away mechanical equipment in a very short time. The chemists also conduct checks of lubricating oil, hydrogen gas for cooling the generators and many other tests related to safe, efficient operation of the

Hydro's thermal power stations generated over 10 billion kilowattrendering them inoperative. The hours in 1966, about one-fifth of the

electricity used in Ontario. By helping to keep these plants operating, Hydro's station chemists and their staffs contribute a great deal towards maintaining the supply of electricity in Ontario.

blind people are helped to lead normal lives again

John Smith has just learned he is going blind and there is no way of reversing the disease which is causing him to lose his sight. What can he do? Where can he turn?

The answer to these two questions and many more which he may have can all be answered by the Canadian National Institute for the Blind through one of its field secretaries who can also help him to come back and lead a nearly normal life

Bill Lawson is one of these field secretaries although he says he is more of a social worker with the blind. He covers the counties of Wentworth, Halton and Peel and his services include working in Milton or Acton. Mr. Smith is a fictional character who lives in this town and Mr. Lawson was asked how he would get to know and help Mr. Smith.

"The first thing I would do," he said, "would be to check on his background and see if he could continue in his present job without sight. Then we would bring Mr. Smith to our divisional office in Toronto for what we call 'Adjustment Training' which is really a course to teach blind people to get along without sight.

"He learns to use a white cane, learns to read in braille and does some work in our workshops. He does not learn a trade here but rather is assessed on his work and our placement officers can tell which job he could eventually be placed in if he can't go back to his old one."

"It takes 10-12 weeks for a person to go through this program in classes of eight to 10 at a time. Our Mr. Smith, upon graduation, has learned how to use his cane and can do grade two braille. If he wants to take up or continue his studies, he can take grade three braille which is a form of

shorthand which makes note-taking a lot

Asked if many blind people use seeing-eye dogs, he said the dogs are bred and trained only in the United States and cost over \$2,000 which includes the training of the blind person and his dog, a male German Shepherd. Mr. Lawson clarified one point, however, when he said that blind persons get these dogs, their own training, accommodation and transportation at a cost of only \$50, made possible from many bequests made to these schools. "Not too many use them in Canada yet," he said.

"Getting back to Mr. Smith," he continued, "he is now away from the training school and if he can't return to his old job, then we find work for him, usually in the CNIB catering service. He will be sent out to work in commercial buildings and plants where these canteens have been set up. I myself started in one of these canteens since my vision is poor."

One thing Mr. Lawson pointe; out was that a blind person can go back to work on such machines as a drill or punch press. Distractions don't bother him and he can concentrate on his job that much more. "A company's compensation rates don't climb either with a blind person on the payroll," he stated.

"The most important thing a blind person has to do is accept the loss of his sight. There are many devices such as talking books and braille writing to help them to adjust. Wristwatches are made with braille numbers on them so a blind person can tell the time."

Mr. Lawson said the CNIB is there to help blind people to re-adjust to an almost normal way of living, and it is men like him who have made it a lot easier for the blind of Canada to do this.
