A tune-up in a bottle

Today's technologically advanced cars demand clean, deposit-free engines. And as service station and auto repair shop costs skyrocket, consumers are demanding simple, effective ways to personally maintain their cars' peak performance.

One simple, cost-saving upkeep tip is fuel additives: chemical formulas designed to eliminate stalling, sluggishness, power loss, decreased mileage, knocks, pings and run-on (dieseling) caused by carbon deposits that build up on engines. Over time, these deposits collect on carburetors and fuel injection systems, decreasing their ability to function properly.

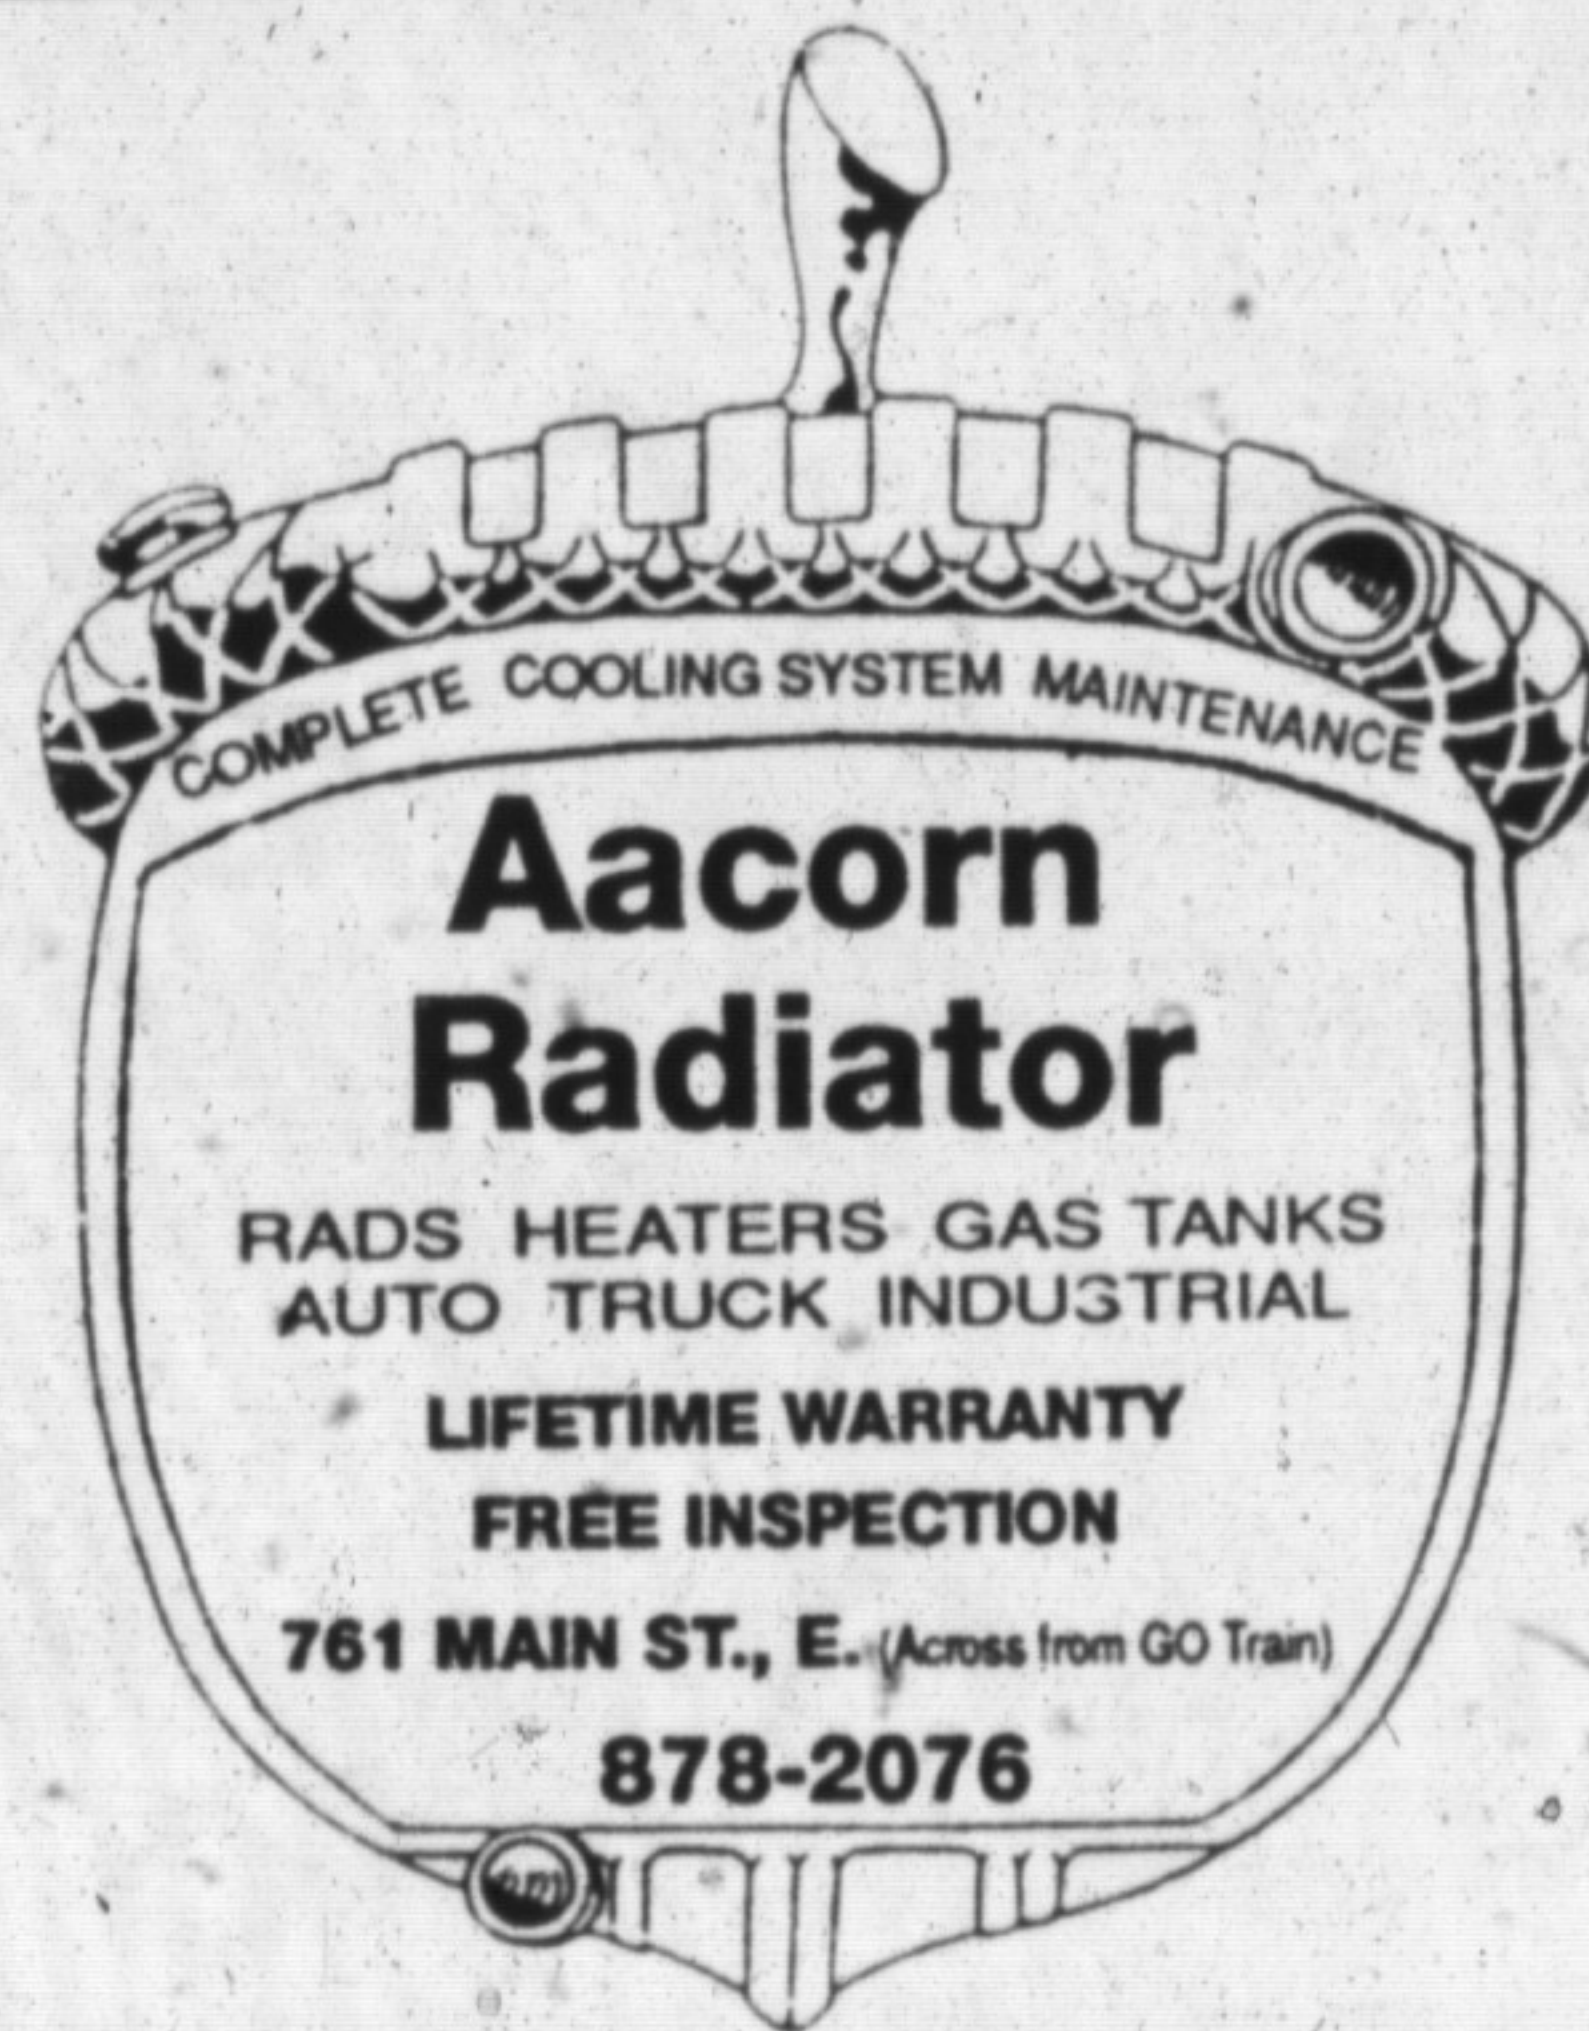

Regardless of the make, model or year, all cars are susceptible to carbon deposit build-up. Newer cars, especially those equipped with fuel injection systems, only perform well when the intake systems are clean. As a result, even small deposits can cause serious performance problems.

Technologically advanced fuel additives like Chevron Chemical Company's Pro-Gard™ are designed to safely break

down carbon deposits and remove them from the engine. All Pro-Gard products are formulated with Chevron's patented Techron™, a polyether amine detergent that gives them the power to remove even difficult combustion chamber deposits safely.

This innovative chemistry, developed in the company's extensive research facilities, has faced rigorous testing in what may be a car engine's toughest environment—the taxicab. After 50,000 miles of driving with normal maintenance, eighty San Diego taxicabs were disassembled for inspection in the lab. The study confirmed that engines using additives formulated with Techron have consistently cleaner intake and fuel metering systems than those using other additives.

Pro-Gard additives are available in four formulas, allowing consumers to select the formula that's right for their car engine's needs: Pro-Gard Clean-Up, an engine cleaner formulated to safely remove deposits throughout the fuel metering and intake systems of dirty engines.
