> EDUCATION. The following is a brief synopsis of the

own business, are determined to leave proper idea of what Education really is It involves the culture and developmen of the various parts of our nature, physi-Outfitters - T. W. Kenny & Sons, 149 (late | is given a hist that the healthful develop ment of any one power involves the culture of the others. The cultivation of the intellect is first specially referred to. This culture involves two elements-in forming and developing-the first a cause, the latter an effect, and the more mportant. We must impart knowledge in su h a way that it will awaken thougut, stir the mind to new ideas by comparison and reasoning. We should aim to awaken a desire for knowledge, and train to the best mest method of acquiring it. Eturather to begin when the child has left

> Next comes the question how this all important development is to be obtained? By exercise. We cannot educate by acting upon the child or working for him -we must secure action on his part. We come back to the means-the our schools. These branches must be taught in such a way as to awaken interest, induce effort, give activity to the mental powers and secure their develop

The different intellectual powers do not come into full activity INSTALLATION OF OFFICERS .- To night the simultantaneously. In the young chilthen memory, then reason. The educationist should conform to this order. It the knowledge presented appeals to a The more we can get the pupil to do for

> a proper method of teaching, and introduce that part of the subject. Method involves the determination of the end in view, and the establishment of an intelligent plan to secure that end. The two each conclusion from some axiom, defiare next referred to - the analytical and examination of the particulars to infer the general-from examples to principles the latter from general principles to their application to various cases.

Young children, and those whose minds are but little developed, require analytic teaching. If we begin with principles and rules, they may commit these to fects of arrangement or demonstration their meaning. We present individual objects or examples, thus appealing to a mental faculty already awakened; the child thus understands the subject, is interested in it, and gives his attention

Guided by the teacher he proceeds from one example to another, fixing his mind on points of resemblance, gradually rising from individuals to classes; from examples to principles and rules. All subjects should be taught this plan to beginners; and after the

mind has become more fully developed SNOW SHOE CLUBS .- The members of and that the pupil is able to trace from he above Clubs would do well to call and the particular to the general, and back inspect the \$5 Blanket Overcoats, at the again, text books, in which knowledge is The teacher is warned against the P. This, we believe, is one of the largest collections of plants in the Dominion, and has now become the property of

> > MATHEMATICAL DEPARTMENT. This department includes the subjects of arithmetic, algebra, geometry, mensurcluding statics, dynamics, hydrostatics in the different divisions and subjects. In arithmetic the second division are thor-

are assigned in the authorized textbook, for the actual preparation of which the students are beld responsible, each recitation, the statements the text book are enlarged upon, thoroughly explained and largely suppleanything of practical importance. Little attention is paid to rule, the pupils being trained in analysis, and in the method o performing all questions of proportion &c., by analysis. In the First Division the students are supposed to be familiar with everything in the text books, and lectures are given on the theory of Interest, Exchange, on Commercial Law, on Joney and its substitutes, on Stocks, and on matters of importance in business life as well as on the theory of numdifficult questions from

sources are taken up discussed before the class, and no pains are spared to make the students perfectly conversant with any question which ikely to arise in life. Instruction in mensuration is given entirely by lectures, the first division applying the elements of trigonometry to solve triangles and other figures. The second division, who do not take rigonometry, are instructed in the

methods of solution not requiring that science. Exercises are wrought out before the class, and in this as in other branches, questions to be solved at home by the students are a constant concomitant of class instruction. In algebra the juniors use "Todhunter's Algebra for Beginners;" the seniors, Sangster's Treatise on Algebra." The

method of conducting classes in this branch is very similar to that described in speaking of arithmetic. The lectures to the first division have hitherto been on SHOOLBRED and least common multiple, simultaneous equations, proof of the determinate value of the roots of independent equations and other cognete questions. The theory of part of the theory of equations; in

this class also the principles of algebra are applied to the explanation of the properties of numbers.

The course in geometry covers for the second division the first three books of Eucli I's Elements; fer the first division. the first six books. Until the class has gone through fifteen or twenty proposi tions, the Professor demonstrates slowly each proposition before them, pointing out the parts in which the entire process may be divided, the mutual dependence of the various parts, the necessity for each step, and the logical consequence of nition or proposition antecedently demonsame process, and the careful atten- rests all disease upon Physiological prinof each is ensured by occabegun by some one elee. In the first division the whole work is gone over pointed out, other methods of demonstration suggested or called for, axioms and CEORGE MORTIMER, definitions investigated, and their mathematical accuracy challenged or vindicated. Every means is taken in this class to call out the criticism of the students themselves upon the questions discussed, and in this, as in the former class, deductions are at each recitation given as home exercise. As occasion offers, the difference between the methods of ancient and modern geometry is explained, and the pupils taught to gen-eralize the conclusions of Euclid, special

attention being paid to Loci. The classes in mechanics are conducted chiefly by lectures. The exercises in the text book, occasionally supplamented by taken for the practical work. The elements of trigonometry are very largely employed in this subject, since it comes of the 5 per cent. in the course of only the senior students. There is as yet no authorized text book on trigonometry, so that this class is conducted entirely by lectures. The functions are from the beginning treated analytically, and the practical use of each conclusion is illustrated by numerous examples. It is intended to give the pupils instruction, REAT AUCTION: SALE not only in the theoretical, but also in the practical part of measurement of height, distance and area, and the application of trigonometry to land surveying, &c. At WATCHES, present, however, the stock of mathematical apparatus being rather limited, only the theory, with examples, can be given. Prof. Riddell is, we understand, engaged in preparing for the press a text book on trigonometry and i.s practical AN IMMENSE VARIETY, applications, for use in High Schools and
