Poetry.

BE JUST AND FEAR NOT. BY THE DEAN OF CANTERBURY. Speak thou the truth. Let others fawn. And trim their words for pay; In pleasant sunshine of pretence Let others bask their day.

Literature.

STREET EDUCATION. Hierony informs us that one of Rome's internal enemies, in wishing to procure his country's downfall, did not by bribery endeavour to convert her statesmen into traitors, or by the promise of plunder, her army into a band of mercenary to effect his object; but by the corruption of his youth.

good, bad and indifferent, are deplorably apparent in the precocious development of many an Arab of the highway. Do we not occasionally raise our indignant voices in protestations against the present condition of some of our jails in the indiscriminate mingling of the less guilty with those hardened in crime? Yet many parents allow the reality innocent to associate with those whose consciences are in a measure seared by frequent acts of transgressions.

In animadverting on an indulgence so alarmingly prevalent, we do not wish to restrict lads who have entered their teens, entirely to the house. On the contrary, we like to see them enjoying their full share of the rights and privileges due to youth; indeed we think that association is necessary in order that they may be manly in action and thought, as they emerge toward manhood in stature.

We have, however, alluded to but one phase of our subject; there is yet another, and it presents itself under a moral aspect ten-fold darker. Deeply to be deplored as may be the inadvertence of parents in this respect by day, it comes far short of the evil consequences of the same unlimited indulgence by night. Al! how many have been wrecked on this hidden rock!

The work of corruption still goes on! A thick undergrowth of noxious shoots are springing up with fearful rapidity, destined to become Upar trees, throwing their demoralizing influence on all within their reach. Under the shades of evening practices, which will not bear the light of day, are entered into with zest and even hilarity.

itary phrase from the slang vocabulary is practiced on till exchanged for a nearer approximation to the ultimatum of profanity—an oath.—The commands of God being broken, the laws of man present but a feeble barrier.

The aptness of children to learn, and the readiness with which they acquire coarse and vulgar expressions, is certainly marvellous. A lad unable to put words together to answer properly a question put to him during the day, swears with astonishing fluency in the shades of evening.

In animadverting on an indulgence so alarmingly prevalent, we do not wish to restrict lads who have entered their teens, entirely to the house. On the contrary, we like to see them enjoying their full share of the rights and privileges due to youth; indeed we think that association is necessary in order that they may be manly in action and thought, as they emerge toward manhood in stature.

We have, however, alluded to but one phase of our subject; there is yet another, and it presents itself under a moral aspect ten-fold darker. Deeply to be deplored as may be the inadvertence of parents in this respect by day, it comes far short of the evil consequences of the same unlimited indulgence by night.

The work of corruption still goes on! Under the shades of evening practices, which will not bear the light of day, are entered into with zest and even hilarity.

make home attractive, teach the younger branches to draw with pleasure around the family centre table, lend a hand, a voice, a heart toward aiding in spending the evening pleasantly; drive trouble to the winds and for a time bid "dull care go home"; your children will love you the better for it; virtue will find congenial soil to flourish in, and vice stunted and uprooted will die on your threshold. Home has been the moral birthplace of most of those who may be classed as good as well as great in History.

Every incentive to work, every encouragement is given to induce the parent to "train up the child in the way he should go." Surrounded by your family you will find "tis pleasant though the loop-holes of retreat To peep without; to see the stir Of the great Babo and not feel the crowd; To hear the roar she sends through all her gates.

At a safe distance, where the dining sounds Fall a soft murmur on the unjoined ear. Then make home happy, make it instructive and profitable, if necessary lay out an occasional dollar, it will be a far better investment than future instalments on extravagance and folly, and in the end will prove an important item to add to the National credit.

LIGHT AND HEAT FROM ELECTRICITY AND THE STARS.

(From the Scientific American.) A very remarkable scientific lecture was lately delivered before the Royal Society in London, by Prof. Miller, its treasurer. He related the results of a large number of experiments which he had made to test the chemical effects of different rays of light upon photographic paper, when transmitted through various transparent substances.

Some bodies which are transparent to light are not equally so to radiant heat. Glass, for example, arrests a large portion of the rays of heat emitted by bodies which are not sufficiently hot to become luminous; but pure rock salt, freely transmits rays of both light and heat from all sources. In light there are also chemical rays, and while common glass absorbs many of these, quartz transmits them freely.

In the case of reflection from polished surfaces, metals were found to vary greatly in the quantity of the rays which were reflected. Gold and lead, although not the most brilliant, reflected the rays more uniformly than the bright white surfaces of silver and specular metal.

With respect to the influence of light from the distant stars, Prof. Miller said: "Conjointly with Mr. Huggins, I have been pursuing investigations with an 8-inch equatorial refractor, and we have obtained some interesting results, having measured the principal lines in the stars Sirius, Betelgeuse and Aldebaran. The light of Sirius, from the measurements of Sir J. Herschel and Mr. Bond, is little more than one-sixth thousandth-millionth part of that of the sun, and although probably not less in size than sixty of our suns, is estimated at more than one hundred and thirty millions of miles distant. And yet it is influencing in a measure the chemical changes which are perpetually occurring upon the earth's surface, and by suitable means the changes may be recorded, estimated, and measured; we have registered these by the photograph from rays which emanated from Sirius twenty-one years ago."
