

DISTRICT SOUTH OF AMOS SHOWS GREAT PROMISE

Expressions of Geo. C. Mackenzie After a Tour Through the District Last Month

Last month Mr. Geo. C. Mackenzie, in company with Sir Thomas Tait, President of Pre-Cambrian Holdings Limited; E. S. Turner, General Manager Canadian Enterprises Limited; W. T. May, Consulting Engineer, and E. J. Thompson, Field Manager for these companies, made a tour of the Hurrieanaw district, south of Amos, Que.

In his impressions of the tour Mr. Mackenzie states that it would require several pages to describe all that was seen in the trip he made through parts of Malartic, Cadillac, Bousquet, and Fourniere Townships. Mr. Mackenzie's report was as follows:

One outstanding impression that remains with me concerns the amount of active development that is taking place along what is called the "main break or fault," which has been traced roughly northwest-southeast for about twenty miles through the townships of Fourniere, Malartic, Cadillac and Bousquet.

"According to well-known geologists who have studied the district for some years, this 'fault' is not only remarkably well-defined and persistent for many miles, but it also possesses characteristics that are most favourable for the deposition of gold-carrying minerals. I desire to avoid the use of geological terms, but at the same time convey the idea that the geology of the faulted country is a strong indication of the presence of valuable ore bodies. Considering the fact that this area began to attract serious attention only four years ago, and with some understanding of the difficulties attending the development of a new mining field approximately 40 miles from railroad communication, I was much impressed with the large amount of progress that has been made in the last 18 months.

"A well-designed programme of underground mining is being prosecuted at the Malartic Gold Mines, Limited, in Fourniere. There are indications that this property may reach the productive stage within 12 months. A respectable tonnage of milling ore is already in sight and underground development is proceeding normally with reasonable expectation that additional mining ore will be added to the reserves in the near future. The Malartic is the most easterly property on the 'main break' that we visited and is also the furthest advanced in development.

"At the western extremity of the 'main break' underground development is proceeding at the Thompson-Cadillac, O'Brien and Graham-Bousquet mines in the Townships of Cadillac and Bousquet. As regards the O'Brien, it is common knowledge that this property possesses an extraordinary high-grade shoot of ore, which persists at the 100-foot level, from which several valuable shipments have been made. Active development is proceeding at the O'Brien.

"As a shareholder in Thompson-Cadillac, which lies between the O'Brien and Graham-Bousquet, I was naturally more interested in this property than in some of the others. An excellently timbered shaft at the Thompson has been sunk to the 300-foot station. It would be premature, as yet, to speak of 'ore reserves' at the Thompson, but that they will develop in due course, is a reasonable expectation from the fact that the vein has been proved in depth and width at the 300-foot level and that free gold may be seen here and there in the vein matter (in the shaft) throughout from collar to sump.

"From what I saw at Thompson I feel that this property has every reasonable expectation of developing into a productive mine, within possibly 18 months.

"Shaft-sinking at the Graham-Bousquet is proceeding on the 'main break.' At the time of my visit the shaft was 50 feet deep. It is, I believe, the intention of the management to cross-cut to the vein at the 50-foot level. The underground work on this property has not reached the advanced state of development of the O'Brien or Thompson-Cadillac and there is, therefore, not much data available on which to base an opinion. However, the 'main break' persists across the width of the prop-

erty, on the surface of which some good 'showings' of ore have been discovered and there is, therefore, the probability that ore may be found to persist at depth. Another two or three months' work at the Graham-Bousquet will demonstrate whether the 'fault' is ore-bearing at depth between the O'Brien, Thompson-Cadillac and Graham-Bousquet shafts. Should this expectation be realized, the value of the three properties will be enhanced considerably.

"West of and adjoining the Graham-Bousquet is a group of claims held by Canadian Enterprises, Limited. The main break persists across the width of this property and has been explored by surface trenching, indicating very favourable prospecting. It is the intention of the owners to continue the surface work and also to diamond drill the 'main break' at several favourable points. This work will be carried on throughout the summer.

"Another group of excellent prospects owned by Pre-Cambrian Holdings, Limited, on the west side of Malartic and east side of Cadillac Townships, were also visited. The 'main break' continues across the width of these properties and a considerable amount of surface prospecting has been accomplished. The outcrops of rock are of the same general type that characterize this formation throughout its known length. Excellent camps have already been established and a crew of men engaged in prospecting for some months. A diamond drill was being shipped into the property at the time of my visit and should be in operation very shortly. The company has an experienced mining engineer and an ambitious programme of work has been adopted for this season."

Sir Thomas Tait, head of the Pre-Cambrian Holdings, Limited, was favourably impressed throughout the trip by the feeling of confidence as to the future of the district south of Amos, in which the principal holdings of the Pre-Cambrian company are located. He also reported satisfactory and promising developments on Malartic, O'Brien, Thompson-Cadillac and Graham-Bousquet properties. W. T. May, consulting engineer, also prepared a report on the area, which has been forwarded to the shareholders of Pre-Cambrian Holdings, Limited.

LITTLE GIRL FELL DOWN HOLE AT COBALT FIRE HALL

A despatch from Cobalt last week says:—"Steps will be taken to protect the opening at the fire hall at Cobalt in which is located the brass pole used by the members of the brigade in sliding to the ground floor when an alarm is turned in. This contemplated action is the result of the narrow escape from serious injury of Cora Panarites, a small child, who fell through the opening at the week-end while the firemen were outside practising for the Dominion Day sports at New Liskeard. The little girl had been chased off four times during the day, Chief Matheson said, but apparently she slipped upstairs unnoticed while the men were on the street. It is understood she was running to the window to watch the motor truck and got too close to the opening, through to the floor below, without touching the pole, a distance of ten feet. She was carried to the office of Dr. E. W. Mitchell by "Doc" Fildes, but was found not to have been hurt, although shaken up and frightened by her experience. The chief is to make enquiries regarding the probable cost of installing guards over the aperture and also of placing in position a mat that automatically opens when required for use when a certain weight is applied against it. It would not yield for a child, Chief Matheson says. He will find out what is done in other centres when he attends the fire chief's convention in Kingston next month. One advantage of the mat it is pointed out, would be to prevent cold winds blowing upstairs in the winter months."

It is estimated that of the total stand of timber in Canada (242,127,000,000 cubic feet), the softwood, or coniferous species account for 418,034,000,000 feet board measure of saw material and 876,568,000 cords of pulp wood, fuelwood, etc. The deciduous, or hardwood species total 39,846,000,000 feet board measure and 412,502,000 cords or 47,458,000,000 cubic feet.

New York Evening Post:—"If the dance marathons want a patron saint, well, there's St. Vitus.

Joyous sparkle . . .
rare, dry flavor . . .
"Canada Dry,"
the drink
of connoisseurs

"CANADA DRY" is served at the embassies in Washington. It is served at the Savoy in London . . . at St. Moritz . . . in tens of thousands of homes in the Dominion. There must be some reason for this universal appeal.

"Canada Dry" is made from pure Jamaica ginger and other absolutely pure ingredients! It is blended with a care and skill which come from generations of makers.

This is really the reason for the distinction of "Canada Dry." The result? A really fine ginger ale which you can distinguish from all others as you distinguish a rare old wine. No wonder it is drunk wherever distinguished people gather! No wonder you will want to serve it to lend that final note of elegance to your dinners! No wonder it mixes well with other beverages.

"CANADA DRY"

This is the Hostess Package of 12 bottles—the most convenient way to buy "Canada Dry."

THESE CAPTURED BEAVERS PROVE EXCEPTION TO RULE

An interesting item of news comes from Amyot, a few miles from White River, where Mr. C. R. McQuown, C.P.R. telegraph operator, has been experimenting with a view to disproving the theory that beaver will not breed in captivity. A few days ago, he was delighted to find that one of the three pairs of beaver he had had some three years, had so far overcome their natural aversion to the proximity of human beings as to present him with a fine husky specimen of this hard-working tribe.—Sudbury Star.
