| Friday, July 22nd    | - Pulp Conversion vs. Wood Preparation                     |

o-o-o

PUBLIC ENEMIES (Reprinted from "The Safe Worker".) There are five especially dangerous public enemies that need to be cornered and put out of action for good. These public enemies we speak of are not men. They are wrong ideas and murderous beliefs, and they are guilty of a great toll of life and limb. They make the prevention of accidents very difficult.

Ned H. Dearborn, president of the National Safety Council, lists these five murderous beliefs as the enemies of human safety and urges everyone to help get rid of them. They cause all kinds of accidents - including industrial accidents.

1. The "Other Fellow" Idea - Why is it that so many people think an accident can only happen to the other guy? Do they think they're smarter or luckier than others? Or do they just think they're so precious Fate wouldn't dare let them be hurt? Any such ideas are silly. Never forget that an accident could happen to you, and it's up to YOU to see that it doesn't.

2. The "Your Number's Up" Idea - An amazing number of people say that "when it's your time, you'll get it, no matter what you do." That's one way to "get it" sooner -- thinking that way. This kind of attitude is often just an excuse for being careless. And if the idea were true, it would be useless to have signs and safeguards in the plant or on the roads and streets, and we could just ignore those fire and fall hazards in our homes. This idea makes no sense at all.

3. The "Law of Averages" Idea - Those who think that a certain number of people must be hurt and killed, according to the "law of averages," are standing in the way of accident prevention. Statistics show that pure chance plays a very small part in accident tragedy.

4. The "Price of Progress" Idea - Some folks who don't think very deeply about the matter will tell you that accidents are part of the price we pay for scientific progress and the complexity of modern life. But if they'd think a little more about it, they might realize that the same type of human intelligence which brings progress can also defeat accidents. No, accidents are not the price we pay for human progress. They are the price we pay for failure to keep up with progress individually in our thoughts and actions.

5. The "Spirit of '76" Idea - It's usually the "tough" guy who contends that the pioneers of our country took great risks, so we should, too. Safety is sissy, growls Mr. Hard-boiled - and where would we be if our forefathers had been sissies? The answer is that they were not sissies, but they were not fools, either. It's hard to imagine one of them sticking his head out of a stockade on a dare while the Indians were waiting for just such a pot shot. And nowadays there is nothing smart or manly about turning a motor vehicle into a murder weapon.

We should look closer to home for the causes of accidents. WE SHOULD LOOK WITHIN OUR OWN MINDS.
