## Kimberly-Clark's effluent channel is a \$1.1 million project- one of six major projects

By Ken Lusk  
The News  
"Aesthetics-  
December 31, 1987, K-C

must have in place visual screening at the points where Blackbird Creek parallels and/or crosses Highway 17."

That, my friends," was one part of the order given to Kimberly-Clark of Terrace Bay by the Ministry of the Environment as

part of the new Control Order. K-C has lost no time in fulfilling this part of the order- this is "one of six major projects that resulted from the control order," said Director of Industrial Relations Daryl Payette.

land that will carry the effluent far from Highway 17.

In total, the new path of the effluent will be about 1,000 feet long. After the substance leaves

Effluent channel

Shown above is Kimberly-Clark's new effluent channel that will re-direct the liquid from beside Highway 17. The tunnel measures nine feet by nine feet. The purpose of the \$1.1 mil-

lion project is two-fold: it will stop the erosion of the highway due to the effluent and it will also put an end to the fog and mist created by the effluent on the highway.

Right now work is on-going to transfer the route of the mill's effluent from beside Highway 17.

The project, according to Payette, is a \$1.1 million-one- its purpose is to "screen or beautify the effluent channel from the mill to Lake Superior."

Workers started about one month ago on the project.

Joe Marcella is doing the work.

### Result two-fold

The result of the project will be two-fold Payette told the News.

Firstly, the work will successfully stop the erosion of the highway due to the effluent; and two, it will reduce the mist and fog on that part of the highway during the winter months caused by the combination of the relatively-warm effluent and the cold air.

### 775 feet long

The major work of the entire project is a 775-foot long, nine-foot by nine-foot tunnel on K-C

Director of Industrial Relations at K-C Daryl Payette.

the new tunnel it will travel down another ditch that is also being constructed now.

### One of six projects

Industrial Relations Director Payette told the News that this is only one of six major projects being carried out by Kimberly-Clark.

All project-directives were the result of the ministry control order issued to K-C earlier this year.

The tunnel project is one of three to be carried out in 1987 and one of six that will occur between now and 1988.

Effluent neutralization and improved spills control are the other two projects slated for 1987 said Payette.

Air quality control, fresh water re-routing and improved foul condensate handling are the three projects slated for 1988.

Payette said more information will be given on the other five projects in the near future.

### Back to school

These Holy Angels students sure seem to be glad to be back at school...maybe there was something wrong with the camera (that would be nothing new). No, the News went to Holy Angels in

Schreiber and these kids sure seemed content with being back. A few of the kids told the News how they really feel about being back. Look inside this issue to find out what they said. (Photo- Ken Lusk)
