# SILOS

Helping Out Poor Fodders Turned Into Ensilage.

Lactic Acid Cultures Now Applied-Good Fodder Requires No Treatment-Sealing the Silo-Make a Compost Heap of Garden Rubbish.

(Contributed by Ontario Department of Agriculture, Toronto.)

Attempts have been made to control or direct acid bacteria. Bacillus lactis acidi has long been known to be beneficial in silage making, and its product, lactic acid, is found to the extent of one per cent. in well made silage. Experience has demonstrated that the addition of bacillus lactis acidi in quantity to the fodder as the silos were being filled gave good results, particularly so when the fodder material was past the best stage for making high-grade silage. The addition of the bacillus lactis acidi in quantity to the more or less spoiled fodder provided an active agent to check and override the other bacteria present and thereby control the fermentative process, and bring the silage mass to a fairly uniform condition with lactic acid predominant in the silage. Add Lactic Acid Culture.

This addition of lactic acid culture to the fodder at the time of silo filling is easily accomplished by securing a small quantity of a pure culture for lactic acid, from a creamery as a beginning. The pure culture obtained from the creamery is placed in a three-gallon can of clean skimmilk. This is placed in a warm position for three days, it can then be added to more skimmilk, increasing the bulk sufficiently to have one gallon for each load of material that goes into the silo. This skimmilk culture carrying a vast number of bacillus lactic acidi is sprinkled over the cut fodder as the silo filling proceeds.

Good Fodder Requires No Culture Treatment.

If the corn is in prime condition for silage making at the time of ensiling, nothing is to be gained by adding culture, however its use is strongly advised if the corn or other fodder is a bit off in condition due to damage through unseasonable weather, delays, etc.-L. Stevenson, Sec. Dept. of Agriculture, Toronto.

# Sealing the Silo.

Several methods of sealing the silo after it has been filled have justified their use. What is wanted is a heavy blanket of material on top as near air 8 10 tf tight as possible. A Minnesota writer

Some times weeds or heavy green grass are run through the cutter as a finishing layer. Some prefer to jerk 9143 the ears from the last two or three loads of corn used so no grain is lost, and allow the corn itself to make the air-tight layer needed to preserve the silage below. At any rate, it is a good practice to tramp the silage around the edges at intervals of three or four days for about two weeks. This helps to prevent the settling away from the wall, which often occurs.

Spoiling at the surface may be prevented entirely by covering the top of the silage when filling is completed with a layer of tar paper cut to fit snugly around the walls and overlapping between the strips. If this is used, it is advisable to weight it with some green material of some kind or with boards. Most farmers, Currey, of the Town of Durham. however, think the use of corn itself solicitor for the Executors, on or were in the Twenty Years Ago Towith the ears removed and with proper tramping is more economical than the use of paper.

In filling the silo the usual recommendation is to keep the surface higher at the sides than in the center and to do most of the tramping near the wall. The last two feet had best be kept about level with the same amount of tramping in all parts of the silo.

# MAKE A COMPOST HEAP.

Save the Garden Rubbish and Make Cheap and Valuable Manure.

Garden waste, decayed vegetables, dead vines, weeds, and the organic rubbish that collects about the place during a busy summer may be cleaned up and put to work again through the agency of a compost heap. Start the heap by laying down a bed of stable manure which has not been burned or heated. The size of the plot will vary with the amount of refuse to be used; for ordinary uses, if the bed is made 8 feet long by 6 feet wide and 2 feet deep it will serve the purpose. Over the manure spread a two-foot layer of refuse and cover with another layer of manure. This last layer need be only a foot in thickness. Repeat the layers until all the waste has been disposed of and then cover the whole with a layer of

earth. If it is desired to add to the heap from time to time the top layer may be opened and the new material emptied into the hole thus made. This is convenient for the suburban home where there is no animal to consume the kitchen waste. In the spring the heap is well mixed with a fork and the compost is ready to be spread on the garden plot. The heating manure will effectively destroy any weed seed present and will also break down the structure of most of the materials that have been thrown upon the pile. The process may be continued inde-

A flock of scabby sheep will infect Dated this 8th day of September, the roads, trails, sheds, yards, bed grounds, pastures, ranges, and the ground around the watering places. It is therefore important that the flock receive proper treatment as soon by her Solicitor, A.B. Currey. as the disease appears, before the infection becomes scattered.
