FRENCH CANADIAN HORSES AT ST. JOACHIM

(Experimental Farms Note.)

It is not generaly known that the largest/horse breeding establishment east of Manitoba is situated at St. Joachim, county of Montmorency, province of Quebec. This farm was started by the united efforts of the Dominion Department of Agriculture, and the French Canadian Horse breeders' Association, and is under the direct supervision of Mr. Gus Langelier who is also Superintendent of the Cap Rouge Experimental Station.

In 1912, a few French Canadian mares were bought, by this station, amongst which was Helene, due to foal in the spring of 1913. She the very first, it was easily seen and at home as well on the plough his native city. that he was an excellent and pre- as on the surrey. potent sire.

young and old, were kept, this ard-bred, but lacks in size. number being decided upon as the maximum, and from 15 to 25 mares blending of all these qualities todrop foals each year.

horses cheaply; wintering young Iron." stock in single-boarded openfront sheds; work versus no work for brood mares, and raising autumn foals. Incidentally, further valuable information is gathered. For instance, a mare brought in foal to an outside stallion dropped a colt which had to be gelded because a cull, whilst the next year, to the service of Albert de Cap Rouge, she gave a youngster which has since been a winner at the larger exhibitions. This shows the value of a good stallion.

The object of the work at the Horse Farm being the fixation of type and general improvement of the breed, naturally quite a number of mares have been eliminated from the stud as breeders, because, though very good individually, they did not produce the right type of

Only teas grown 4,000 to 7,000 feet above sea level are used in "SALADA" Orange Pekoe Blendthe flavour is therefore richer, more fragrant and much more delicious than other teas. Only 43c per $\frac{1}{2}$ -lb.—Buy it at any grocery store.

dropped Albert de Cap Rouge, now horse, as the point is to breed a admitted to be the best stallion of race of horses weighing around the breed. When only 22 months 1200 pounds in ordinary condition, due out of Euston and a Glasgow old, Albert was used on a small but sound, hardy, full of energy but Scot was inquiring at the third select bunch of mares and, from docile, fast walkers, good lookers, class wicket, the price of a single to

The market for horses is rather low but it seems to be the opinion of keen observers that there will, be, within a few years, a shortage of work horses. The older animals of necessity are being put aside and little breeding has been done in the way of replacing them. This should be the time for farmers to consider horse-breeding seriously, starting with a firm determination to breed only from sound stock. They will surely lose money if they do other-

The French Canadian is probably the best general purpose horse in existence, strong enough for farm work and fast enough for the road. It is acknowledged that he is not as strong as the drafter, though someday pulling contests may show that he is stronger per hundred pounds of live weight. It is also acknowledged that he is not as fast at the trot as the Standardbred, nor at the gallop as the Thoroughbred, but these two breeds have their place in a different sphere and do not, in fact cannot, compete with the French Canadian as an agricultural

tucky blue grass and white clover are useful permanent pasture Read The Chronicle ads on page 7. plants for hillsides. Alfalfa is a splendid crop, sweet clover and the common mixture of red clover, alsike and timothy may also be used. Oats, rye, wheat and corn are crops frequently grown on rolling lands but these crops are not so effective in controlling erosion as hay and pasture crops.

Fall and winter applications of manure to hillsides are not desirable, but spring applications, ploughed under before any loss of fertility takes place, are very desirable. A light manure application of a mixture of 50 pounds of nitrate of soda. 200 pounds of superphosphate and 25 pounds of muriate of potash would constitute good dressings for the improvement of meadow and pasture crops. These materials should be applied as soon as possible after the spring freshets are over. For acid soils one ton of finely ground limestone may be used with profit.
