Barlow, late of the town of Durham in the County of Grey, Retired Farmer, deceased, who died on or about the fifteenth day of April, A. D. 1929, to send or deliver to the under mentioned Solicitors for the Executors, full particulars of their claims duly proved, on or before the fifteenth day of May next.

AND TAKE NOTICE, that after such last mentioned date, the Executors shall proceed to distribute the assets of the said deceased among the parties entitled thereto, having regard only to the claims of which they shall then have notice, and the said Executors will not be liable for the said assets, or any part thereof, to any person or persons of whose claim notice shall not have been received by them at the time of such distribution.

DATED at Durham this nineteenth day of April, A. D. 1929. LUCAS & HENRY, Solicitors for the Executors.

AUCTION SALE
OF VALUABLE REAL ESTATE INCLUDING VALUABLE STORE IN THE TOWN OF DURHAM

The undersigned will offer for sale by Public Auction on SATURDAY, MAY 4, 1929 at the hour of 2:30 o'clock in the afternoon at The Hahn House in the Town of Durham, the following valuable property, namely:

BUCKWHEAT AS A FARM CROP
As a general purpose crop, suited to farming conditions in Eastern Canada, buckwheat should not be overlooked.

BUCKWHEAT has a variety of uses. It is well known that the flour made from this crop commands a high favor in making griddle cakes and the popularity of the crop for this purpose creates a fairly steady demand.

BUCKWHEAT can be used as a feed for live-stock although the feeding value of the grain is less than in wheat, oats or barley.

On account of its unusually succulent leafy growth, buckwheat serves a useful purpose as a smother crop for weeds. Weedy land can be kept clean cultivated until mid-June or later and then seeded to buckwheat.

The fact that buckwheat will thrive on comparatively poor, light land, makes it an excellent crop for this type of soil, and also to plough under as green manure.

BUCKWHEAT has been used as a nurse crop for sweet clover with good results. When this practice is followed, the combination can be cut green and used as a soiling crop.

The abundance of flowers, carrying that characteristic and pleasing aroma so familiar to all of us, makes buckwheat one of the best honey producing plants.

In buckwheat then, we have a crop, suited to fairly moist cool conditions; able to thrive on comparatively poor soil; valuable as a smother crop for weeds or as an emergency crop sown late in June; useful as a green manure, as a live-stock and poultry feed, and as a bee pasture.

CLOSE GRAZING OF PASTURES
As long ago as 1893, the importance of wide variations in the protein content of grasses at different stages of growth was recognized.

It is unlike other preparations in that it feeds the nerves through the heart.

Dr. Agnew's Heart Remedy
A treatment of unequalled merit for weak hearts, weak blood and weak nerves.

THE WOMEN'S U. F. O. CLUB WILL meet at the home of Mrs. George Turnbull Jr., Ebenezer, on Friday, May 3, at 2:30 o'clock.

EXPERIMENTAL FARM NOTES AND BULLETINS

BAKING QUALITIES OF GARNET WHEAT
A new variety of hard red spring wheat produced by the Experimental Farms Branch, Department of Agriculture, Ottawa, Canada, and bearing the name "Garnet", has been under test at various Experimental Stations throughout Canada for a number of years.

Garnet is distinguished chiefly by its ability to mature from seven days to two weeks ahead of the standard variety Marquis, and to produce excellent yields of hard red (non-plebeid) grain, under widely varying conditions.

The flour of Garnet, in its natural condition, is usually somewhat more creamy in color than is that of Marquis. This applies also to the crumb.

Whether or not Garnet when mixed with Marquis, actually may offer any serious difficulties from a milling standpoint is a matter of some importance. It would seem necessary also to decide whether the color of the flour of Garnet is likely to be a factor in determining the value of the variety, especially for the Old Country trade.

While Canadian millers would seem to prefer the whiter flour of Marquis, there is some evidence that the somewhat creamy color of the flour of Garnet if not actually preferred by certain British millers, may at least be of no commercial significance.

While Canadian millers would seem to prefer the whiter flour of Marquis, there is some evidence that the somewhat creamy color of the flour of Garnet if not actually preferred by certain British millers, may at least be of no commercial significance.

young grass in continuous supplies. This is done by cropping the area fairly close, moving the animals, heavily fertilizing with nitrogenous fertilizers e.g. nitrate of soda, and allowing the grass to grow, say, ten days or a fortnight, before again cropping.

While the final results for 1928 cannot yet be stated they differ in some respects from those of the preceding summer. From the data for 1927 and 1928, however, it is evident, that the greatest amount of digestible protein comes from grass of, say, 4 inches in height, but that the period of growth required will vary with climatic conditions, notably heat and rainfall.

The plots in 1928 also furnished abundant evidence, that continued cropping, results in the spread of clover, especially white clover, a legume of high protein content.

Close-grazing has its practical difficulties and the adoption of a scheme calling for the systematic cropping of an area, with the attendant expenditure for fertilizer, labor and fencing, would not be generally economic in Canada. Nevertheless, the principle is sound and adaptation of the scheme may be found which would meet local conditions and at the same time increase the feeding value of our pastures.

THE IMPORTANCE OF NON-BROODINESS IN POULTRY
Only a few years ago, a large number of people who kept poultry, considered broodiness in their flock an asset rather than a possible liability.

With an increase, especially since 1918, in the number of poultrymen, and therefore an increase in the intensive system of housing the birds, a menace has arisen in the shape of ground contamination, so that it is all-important that the chicks each spring should be reared on clean ground.

If broody hens are used as a hatching or rearing medium, it is only natural to suppose that they will pass on to their chicks any intestinal parasites or disease with which they may be infected.

By breeding out broodiness from a flock the incentive to use incubators and brooders is increased, thereby safeguarding the flock to some extent.

It is quite possible to breed out broodiness by keeping a record of the number of times the pullets in a flock go broody in a year, and then culling those birds which have been broody, say, more than twice. Of course, if a male is purchased, it should be from low-broody stock.

Broodiness has been decreased considerably on the Dominion Experimental Station, Summerville, B.C. over a period of years by these breeding methods.

If we admit into the category of "minimum broodiness" pullets which have not been broody more than twice during their first laying year, we find that 36 per cent of the pullets recorded broodiness more than twice in 1922-23, but by 1927-28 this had been gradually reduced to 12 per cent.

Production on the poultry plant had correspondingly increased until in the latter year the pullets averaged 230.4 eggs per bird without culling.

Taken over the period of years, 1922 to 1928, the pullets showing broody tendencies twice or less gave far higher egg production than those going broody more than twice. In fact, it is doubtful whether the latter, as a group, paid for their board.

Paris thunders: "Girls, be thin!" And the beanpole shape comes in. London, in due time observes: "Ladies, it is time for curves." And at once, no whit confounded, All the girls are sweetly rounded.

Women are a fickle sex, Now concave and now convex; Sometimes tiny, sometimes bigger, Fluctuating as to figger; Watching with observant glance London, England; Paris, France. —S. K., in Spokesman-Review.

An Irishman, who was an eligible bachelor, visited a widow in the district every evening and had tea with her. A friend suggested that he should marry her.

"I have often thought about it," he said, "but where should I spend the evenings then?"

McKECHNIE MILLS

We have full lines of FLOUR, FEED, BRAN, SHORTS POULTRY FEEDS and MASHES at reasonable prices.

Also Fertilizers, Agricultural Lime and Acid Phosphate.

CAR FEED ARRIVING THIS WEEK Bran \$34 Shorts \$35 White Middlings \$40

Owing to loss of our dam we must have early settlement of all accounts.

Will You Have Baby Chicks This Spring

In Grandmother's day they used to talk about a person's "luck" in raising chicks. And they were right. If one raised a goodly percentage of their chicks they were lucky, indeed.

Today all the luck has been taken out of chick growing. Now we know what is needed to raise chicks and how to properly grow practically every one that is hatched.

One of the big points in chick raising is feeding Pratts Baby Chick Food. It gives the best results and raises the most chicks because it is carefully and scientifically made of the very finest selection of chick growing and health producing ingredients that money can buy.

GET YOUR PRATTS FROM Cross & Sutherland Hardware Co. Phone No. 1 Durham, Ont.
