Canning Crop Peaches

"The prospect of large requirements representatives of fruit industry, at the by canners for canning varieties of Imperial Economic Conference, is peaches is very bright this year." This proposed Empire Fruit Growers' Fedwas the recent statement of C. W. eration, the first conference to be held Bauer, Secretary of Ontario Growers' in London, England, in September, 1933 Markets, Council. He went on to say their stocks are entirely depleted of towards the improvement of fruitlast year's pack, while wholesale and growing within the Empire. The proretail grocers, throughout the Province visional agenda for the first organiprefer Ontario canned peaches to any zation meeting includes such subjects other pack offered for sale, and are a- as: the production and distribution of waiting this year's stocks.

Bill of Lading Protects Farmers

"Excellent progress has been made Empire advertising, cold storage, transin applying Bill of Lading regulations portation and standardization of packto truck movement of live stock," states ages. Garnet Duncan of the Ontario Marketing Board staff.

"Farmers appreciate the protection offered by this system against irregularities practised by some truckers," continued Mr. Duncan, "and most reliable truckers support the system as it saves time and protects them from unfair competition. Weekly records show the use of lading is increasing steadily.

Ploughing Practise

A series of experiments carried out at a government experimental station has given some interesting results in regard to ploughing at different depths and times.

On an average over a period of nine years, ploughing four inches deep for a rotation of corn, oats, clover and timothy has given higher yields than has ploughing seven inches deep, except in the case of oats, in which the yields have been practically the same. The shallow ploughing is of particularly advantage to the corn crop.

In the preparation of sod land for grain, it has been found that ploughing in July, as soon as the hay is off and top-working during the summer has not only given higher yields of oats. but also has left the land free from couch grass. The experiment has shown that on sandy loam soil, it does not pay to either rib the land or re-plough in the fall. On heavy clay soil, ribbing or re-ploughing late in the fall gives the frost a chance to mellow the soil and leave it in a better state of tilth.

In the preparation of sod land for manuring and fall ploughing.

and top-worked.

Weekly Crop Report

Bruce County reports that after harvest cultivation is being practised fairly generally. Grey has had discouraging wet weather, with the result that many fields were left in stook and much second-cut alfalfa still in coils in fields. A farmer in Peel has 11/2 acres of Okra, which is a plant similar seed as anticipated owing to continued siderably higher. rains during blossoming period. Harvesting of sugar beets in Kent is starting. With over 20,000 acres of this crop to be harvested there, many unemployed will find work. In Middlesex Agricultural Economics Department, silo filling is now general, with the Ontario Agricultural College, Guelph, crop a bulky one, heavily loaded with will begin the collection of cost and well matured cobs. Corn borer and income data from apple growers in storms have broken the crop down bad- Norfolk County on August 8th. This ly in some fields. Cock-Conlocal demand.

in timothy seed. This is to be expected from the high price of timothy seed last year in comparison with legume seeds and also to the fact it is necessary to import about 50 per cent. of the seed used in Ontario.

Prices for all seeds are likely to be higher this year. The price no doubt fuchsia-A. Edge, W. Clark. Flowering Cock-Wilson 1 and 2. Hen-Wilson 1 will be governed to some extent by the amount of seeds held over from the large 1931 crop.

NEW POTATO TEST

Cooking authorities agree that for salad making new potatoes are far the best. In addition to their sweet delicate flavor which makes them so appetizing, new potatoes are firm and not too mealy, and for this reason they can be cut into cubes without danger W. Clark, J. Hamilton. Bouquet, house of breaking down when combined with of breaking down when combined with nament—W. Clark, Mrs. Glass. Collectory other ingredients of the salad. Potato tion Roses—J. Mather. It is good at any time.-Dominion Fruit Branch.

FIELD CROP FIGURES

The fifth departmental report of the season on Field Crops gives some interesting facts and figures. More than the ordinary amount of stook threshing was done this year, but the weather was not to favourable for this atthe outcomes of discussions among tempt at labour-saving. Farmers are planning to sow their fall wheat somewhat later than usual in order to reduce the likelihood of injury from Hessian Fly. Buckwheat and hoed crops have made good growth during the month and excellent yields secured from second cutting of alfalfa.

> The total acreage of field crops sown in Ontario in 1932 is practically the same as last year. The most important change in individual acreage occurred in barley, buckwheat, fodder corn and alfalfa which showed increases, and hay clover, beans and potatoes which show large reduction in acreage. The total production of both beans and potatoes will show considerable decrease from last year, for in addition to reduction in acreage, the per acre yields are lower owing to less favourable growing conditions.

The estimated average yields of spring wheat, oats and barley for Ontario this year show little variation from the figures for 1932. Oats and barley gave rather disappointing yields in Southwestern Ontario and slightly to Red peppers and whose pods are higher yields than last year in other used for thickening soup. The crop districts. Per acre yields of flax and from Peel will be greatly reduced this beans show some decrease over last year, as the second crop did not set year while the yield of peas is con-
