THE MALADY OF THE CAY.

APPENDICITIS SALL TO BE DUE TO MEAT EATING.

A French Physician Says That Flesh Diet Causes the Disease.

Appendicitis is the malady of the day; it is the most prominent malady in the course of the discussions of the learned societies. Its causes must be numerous; in any case the theories emitted respecteing its appearance are manifold.

M. Metchnikoff, in a recent communication to the Paris Academy of Medicine, attributed an important part in the development of appendicitis to intestinal worms, ascarides and trichocephales, expecially the last named, which, by causing erosions of the intestinal mucous membrane, create an easy means of infection by the morbid germs contained in the intestine.

Northern China is, perhaps, of all countries in the world, the one in which helmonthiasis is the most widely spread, and a recent communication presented to the Academy of medicine in reply to M. Metchnikoff's communication, M. Matignon states that appendicitis is very rare there is probably none in which the there, even if it is noticed at all.

are also met with.

Northern china never met with A SINGLE CASE

of appendicitis, either in the French missions or in the hospital at Nantang. Nor did he meet any during the same period among the little international community of 120 persons who were under his care. Three times only-in the case of a young Russian girl and of two Lazarist missionaries—did he observe abdominal pains having a distant resemblance to appendicular colic, but they appeared to be due to the presence of a toenia in the intestinal tube, for they were not reproduced after the expulsion of the parasite.

The extreme rarity of appendicitis -not to say its non-existence-among a people whose digestive tube is infested with worms appeared to M. Matignon to be in conflict with the theory of M. Metchnikoff, which tends to attribute to lombricoids an for all this, then, is to apply the not need all of the nitrogen at one important part in the appearance of fertilizers before planting time, in time, it is best to divide the nitrate

The diet of the Chinese, in the north, says M. Matignon, is not esh diet, but rather vegetarian. At Pekin and in the country very little beef is eaten, fowls and ducks, mutton, and especially pork, being preferred. Europeans alone eat beef.

MEAT IS A LUXURY which only the well-to-do can afford, and its consumption is extremely small. The great majority of the population, who are poor, mostly consume millet, simply boiled in water; a little rice, cabbage, sweet potatoes, turnips preserved "a la saumure." and a quantity of garlic. From the Review, Windsor, Ont. The Chinaman also eats a great

It would appear that compresses of alcohol may be used in the treatment of appendicitis. At rate, M. Filatoff so asserts. He began to use this treatment from the day when alcohol, used as a tonic at the early period of whitlow, appeared to him to be endowed with specific properties. This surgeon, in fact, considers that it suffices to keep the finger in a small glass of brandy

FOR HALF AN HOUR

and repeat the bath several times a day to put a stop to the pathological processes on the point of break-

This conclusion led M. Filatoff to have recourse to the application of compresses of alcohol in the case of me. The trip to Colorado was a boy twelve years of age, suffering abandoned, and I continued using the from appendicitis, in which he was pills until I had taken eight or nine sent for in consultation. HARVEST SONG.

Summer all is a pleasure past, Summer charm is a tale that's told; Days of reaping have come, at last, Days of ripeness and days of gold; Down the meadow-way, glad and strong.

Love comes singing his harvest song.

Love is brown with his harvest toil, Brown, and brawny of limb is he. Master strong in the garden-moil, Lord of pasture and plant and tree; Treasure-burdened, he plods along, Singing brightly his sarvest song.

And in answer the autumn breeze Sings a pleasant and fair refrain, Through the bows of the orchard

O'er the fields of the waving grain. Hark, the echoes about him throng-Nature's singing her harvest song.

tried medicines, but they did not help me in the least. Dectors did not seem able to help me or tell me what ailed me, although their bills increased with alarming rapidity. I grew so weak, and so despondent that finally I decided to take a trip

to Colorado to see if a change of climate would benefit me. While contemplating this trip I read in a paper one day the testimonial of a person whose symptoms were almost identical with my own, who was cured by Dr. Williams' Pink Pills. I decided to give them a trial and purchased a box. When that box was done I got another, and found gradually that the pills were helping

these suggestions without danger of loss.

The three plant foods which have to be supplied are phosphoric acid, potash and nitrogen. Phosphoric acid can be used in the form of acid phosphate, dissolved bone, ground bone and boneblack. These materials can all be used several weeks before planting time, and worked into the soil. It is best to work them in, as there may be loss from surface washing, and again by working in they are within easy reach of the plant roots. The forms of potash are: muriate of potash, sulphate of and kainit.

sults when used in the same way as the phosphoric acid. In fact, authorities recommend that the potash ing the four years that he spent in one particle of benefit to the growing and phosphoric acid should be apcrop, they must be changed from the plied together several weeks before the seeds are planted. There is fit-Every opportunity should be given the danger of these mineral fertilizers to facilitate this change. > CABBAGE AS STOCK FOOD. The value of cabbage as food for stock may be summed up as strong in two points, the large amount that can be grown upon an acre of soil and its succulency, which makes it a milk-producing food easily digested. But it requires strong soil and good cultivation, does not keep well for winter use unless pitted where will be frozen until spring and even then having but a short season, while if stumps and any decayed leaves are fed it is almost impossible to prevent it imparting a rank, unpleasant flavor to the milk and butter, or even to the meat, unless its use is discontinued two or three weeks before the slaughtering. DISCOVERY OF A TOWN.

An entire town has recently been

Radium Has Wonderful Power and is Highly Expensive.

Bottled sunshine has at last become a possible thing, though somewhat costly. Radium is the mineral which promises to furnish us with practically enduring bottled sunshine. The peculiarity of this bottled sunshine, however, is that it is without heat.

Prof. Langley, who has been making experiments in this direction, recently received two hermetically sealed vials containing radium, a mineral discovered by Mme. Tklodowska Curie, a Polish chemist, in the salts of uranium. The professor has found radium to possess wonderful properties. From these vials, which are each about the size of your little finger, an unceasing greenish-white light issues.

mediate surroundings a peculiar glow, like that from X-rays. One of the vials contains a white, starchlike powder; and the other a similar substance broken into cubes with faces a tenth of an inch in dimension. In the dark these vials give sufficient light to enable one to read a printed page held closely to them. quantity of radium leads the scientist to the conclusion that half a pound of the mineral, if thinly spread out, would light an ordinary sitting-room.

Moreover, if in giving off light the radium parts with energy, it is so slight as not to be measurable, an estimate being that an almost indefinite time would be required to exhaust the light-giving properties of the two small vials in question. Its energy is apparently in the mineral itself, for after being in the dark for a couple of months the light given forth was nowise weaker. Curiously enough chemists used to treat radium as though it were practically valueless, but now the m ner-
